Dedicated to Professor Richard R. Schmidt on the occasion of his 78th anniversary

Abstract
The synthesis of trisaccharides $1$ and $2$, which contain the $\alpha$-D-galactopyranosyl-(1→3)-$\beta$-D-galactopyranosyl ($\alpha$-Gal) motif, is described. A key step in the synthesis of the trisaccharides was the glycosylation of a monosaccharide acceptor with a disaccharide trichloroacetimidate donor. Subsequent modification of the products of this [2+1] glycosylation afforded $1$ and $2$, which contain an activated ester moiety suitable for reaction with, for example, proteins or amine-coated surfaces.

Keywords: $\alpha$-Gal antigen, imidate, neoglycoconjugate, activated ester, immune tolerance

Introduction
The $\alpha$-galactopyranosyl-(1→3)-$\beta$-D-galactopyranosyl disaccharide motif, also known as the $\alpha$-Gal antigen, is found commonly on the surface of mammalian tissues with the exception of old world monkeys and humans.\textsuperscript{1} This antigen has long been identified as a contraindication for xenotransplantation.\textsuperscript{2} Although the problems associated with xenotransplantation have been largely overcome by the advent of $\alpha$-Gal knockout pigs,\textsuperscript{3,4} the role of $\alpha$-Gal epitopes in transplantation\textsuperscript{5-7} and in several disease conditions\textsuperscript{8-11} is still under investigation. There is also growing interest in the use of bioconjugates bearing the $\alpha$-Gal epitope in cancer therapies\textsuperscript{12-15} and vaccine development\textsuperscript{16} to enhance immune responses. Access to synthetic $\alpha$-Gal epitopes is required to facilitate most of this research.

$\alpha$-(1→3)-Galactosyltransferase knockout (GTKO) mice have been routinely used to study the immune response to carbohydrate antigens.\textsuperscript{17} Analysis of $\alpha$-Gal response in GTKO mice is considered a good approximation for the study of accommodation and immune tolerance induction in transplantation of ABO-incompatible organs in humans,\textsuperscript{18} as the $\alpha$-Gal epitope is
found in the A and B blood groups.\textsuperscript{19} As part of a larger investigation on the preparation of glycosylated nanomaterials\textsuperscript{20} for use in generating immune tolerance against carbohydrate antigens in neonates, we had the need for \( \alpha \)-Gal-containing oligosaccharides functionalized with an activated flexible linker, which would be used for the attachment to various surfaces. We describe here the synthesis of two such targets, trisaccharides \textbf{1} and \textbf{2} (Figure 1).

\caption{Structure of targets \textbf{1} and \textbf{2}.}
\end{figure}

\section*{Results and Discussion}

Production of \( \alpha \)-Gal epitopes for biological studies is often achieved by chemoenzymatic means.\textsuperscript{21-23} Access to these compounds via this approach involves the use of recombinant \( \alpha \)-(1\( \rightarrow \)3)-galactosyltransferase enzymes and chemically modified substrates. Although this method is efficient and provides sufficient material for biological assays, access to larger quantities of material still favours chemical synthesis.

Several groups have reported the chemical synthesis of oligosaccharides incorporating the \( \alpha \)-Gal epitope.\textsuperscript{24-28} For example, Wang and coworkers achieved the synthesis of an \( \alpha \)-Gal pentasaccharide via a one-pot strategy using various thioglycoside donors.\textsuperscript{24,25} Schmidt and coworkers described the synthesis of a related pentasaccharide using a convergent approach and trichloroacetimidate donors.\textsuperscript{27} In another investigation, Litjens et al. reported the one-pot synthesis of an \( \alpha \)-Gal trisaccharide using thioglycoside donors.\textsuperscript{26} Most previously reported synthetic routes to the trisaccharides such as \textbf{1} and \textbf{2} involve the selective protection and glycosylation of a lactose or lactosamine acceptor. We decided instead to prepare an \( \alpha \)-Galp-(1\( \rightarrow \)3)-Galp disaccharide donor as a precursor and then react it with a monosaccharide acceptor. This would allow us to change the acceptor thus allowing for a straightforward convergent approach to the preparation of \( \alpha \)-Gal-containing tetra- and pentasaccharides at a later stage.

The preparation of \textbf{1} and \textbf{2} was accomplished using trichloacetimidate donors developed originally by Schmidt and co-workers.\textsuperscript{29} First, the \( \alpha \)-Galp-(1\( \rightarrow \)3)-Galp linkage was achieved in good yield and stereoselectivity by reaction of trichloroacetimidate \textbf{3} and thioglycoside alcohol \textbf{4} using diethyl ether as a solvent (Scheme 1).\textsuperscript{30} To perform this reaction, thioglycoside \textbf{4}, which was sparingly soluble in diethyl ether, was dissolved in a binary mixture of diethyl ether and dichloromethane (10:1). Reverse dropwise addition of the trichloroacetimidate donor \textbf{3} to the
solution of 4 at –10 °C in the presence of TMSOTf as an activator gave exclusively the desired α-linked product, 5, in 76% yield. The α-stereochemistry of the newly formed linkage in 5 was readily apparent from its $^1$H NMR spectrum; the value of $^3$J$_{1,2}$ was 3.0 Hz. This reaction was easily conducted in gram scale quantities with no change in stereoselectivity, thus providing large amounts of material for further synthesis.

![Diagram of the reaction](image)

Scheme 1. Preparation of trisaccharides 13 and 14.

Direct coupling of the resulting thioglycoside 5 with the acceptors 8 and 9 could not be achieved, even in neutral conditions. We attribute this to the electrophilic by-products produced during the reaction, reacting with the alkene moiety in the acceptor. Thus, thioglycoside 5 was first transformed into the corresponding hemiacetal 6 in 84% yield, by the action of N-bromosuccinimide in acetone, and subsequently converted to trichloroacetimidate 7 by treatment with trichloroacetonitrile in DBU.

Coupling of trichloroacetimidate 7 to either 8 or 9 proceeded uneventfully to give the corresponding trisaccharides 10 and 11 in 87 and 83% yield, respectively. The β-stereochemistry
of the newly formed bond in both molecules was confirmed by the $^{3}J_{H1,H2}$ in 10 and 11, which were 8.1 Hz and 8.0 Hz, respectively. The azido acceptor was chosen as an aminosugar precursor, primarily for ease of conversion to the desired N-acetyl group. This transformation could be achieved by reaction of 11 with thioacetic acid in pyridine, providing the expected acetamide derivative in 83% yield. Simultaneous deprotection of the benzoyl and benzyl protecting groups in 10 and 12 was carried out using dissolving metal reduction. This was achieved by reaction of each compound with sodium metal in THF/CH$_3$OH, conditions that allowed the removal of the benzyl groups while leaving the alkene functionality intact. In addition, the benzoate esters were cleaved under the basic conditions of the reaction.

Having in place a robust route for the preparation of 13 and 14, we investigated their conversion into 1 and 2. The octenyl linker of 13 and 14 was further functionalized by first introducing a cysteamine residue via a UV-promoted thiol–ene reaction to give the corresponding amines 15 and 16 as their hydrochloride salts in 90–97% yield (Scheme 2). Further elaboration of the linker using di-p-nitrophenyl adipate in dimethylacetamide gave the highly reactive p-nitrophenol (PNP) esters 1 and 2. The final products were lyophilized and could be stored at –20 °C without significant degradation over time.

Scheme 2. Preparation of activated PNP ester derivatives 1 and 2.

Conclusions

In summary, we report an efficient route to α-Gal trisaccharides 1 and 2 via a route in which a key transformation is the reaction of a disaccharide trichloroacetimidate donor with a monosaccharide acceptor. This route should be applicable to more complex glycans containing the α-Gal antigen. The use of 1 and 2 in the preparation of nanoparticles containing this motif is underway and will be reported in the future.
Experimental Section

General. Reagents and solvents were purchased from commercial sources and were used without further purification, unless otherwise stated. Dry solvents were purified by successive passage through columns of alumina and copper under nitrogen. Reactions were conducted in an inert atmosphere of argon gas, unless otherwise stated. Thin layer chromatography (TLC) was performed on E. Merck Silica Gel 60 F254 aluminum-backed plates that were stained by heating (>200 °C) with either p-anisaldehyde in 5% sulfuric acid in EtOH or 10% ammonium molybdate in 10% sulfuric acid. Unless otherwise indicated, all column chromatography was performed on Silica Gel 60 (40–60 µM). C18 silica gel (35–70 µM) was manufactured by Toronto Research Chemicals. Optical rotations were measured at 589 nm, at 22 ± 2 °C and are in units of deg·dm⁻³·cm⁻¹·g⁻¹, in all cases the concentrations are in units g/100 mL. ¹H NMR spectra were recorded at 500 MHz, chemical shifts were referenced to the peak for TMS (0.0 ppm, CDCl₃) or CD₃OD (3.30 ppm, CD₃OD). ¹³C NMR (APT) spectra were recorded at 125 or 100 MHz, and ¹³C chemical shifts were referenced internal CDCl₃ (77.1 ppm, CDCl₃) or CD₃OD (49.0, CD₃OD). High resolution mass spectra were obtained using electrospray ionization in the appropriate solvents.

p-Tolyl 2,3,4,6-tetra-O-benzyl-α-d-galactopyranosyl-(1→3)-4-O-acetyl-2,6-di-O-benzoyl-1-thio-β-d-galactopyranoside (5). Acceptor thioglycoside 4 (1.5 g, 2.80 mmol) was dissolved in Et₂O–CH₂Cl₂ (10:1; 55 mL) containing 4Å molecular sieves and the solution was cooled to –10 °C. TMSOTf (0.10 mL, 0.56 mmol) was added, followed by the dropwise addition of a solution of donor trichloroacetimidate 3 (2.7 g, 3.94 mmol) in Et₂O (10 mL). Stirring was continued for 20 min and then triethylamine (5 mL) was added. The mixture was filtered through Celite, the filtrate concentrated and the resulting residue was purified by chromatography (hexane–EtOAc; 4:1). The pure product (5) was obtained as a colourless oil (2.26 g) in 76% yield. [α]D +78.0 (c 1.0 CHCl₃). ¹H NMR spectra were recorded at 500 MHz, chemical shifts were referenced to the peak for TMS (0.0 ppm, CDCl₃) or CD₃OD (3.30 ppm, CD₃OD). ¹³C NMR (APT) spectra were recorded at 125 or 100 MHz, and ¹³C chemical shifts were referenced internal CDCl₃ (77.1 ppm, CDCl₃) or CD₃OD (49.0, CD₃OD). HRMS-ESI (m/z) calcd for C₆₂H₆₃O₁₃SNa: 1081.3803. Found [M + Na]+ 1081.3798.

7-Octen-1-yl 2,3,4,6-tetra-O-benzyl-α-d-galactopyranosyl-(1→3)-4-O-acetyl-2,6-di-O-benzoyl-β-d-galactopyranosyl-(1→4)-2,3,6-tri-O-benzyl-β-d-glucopyranoside (10). Thioglycoside 5 (1.2 g, 1.13 mmol) was dissolved in acetone (30 mL) and cooled to 0 °C. N-Bromosuccinimide (0.4 g, 2.27 mmol) was added and the mixture stirred in air until the reaction was complete. The reaction mixture was then diluted with EtOAc (150 mL) and extracted with
saturated aqueous NaHCO₃ (2 x 100 mL), dried (MgSO₄) and evaporated. The oil obtained was purified via column chromatography (hexane–EtOAc 2:1) and the resulting hemiacetal 6 (0.5 g, 0.52 mmol) was then dissolved in dry CH₂Cl₂ (20 mL) and cooled to 0 °C. Trichloroacetoni trile (0.21 mL, 2.1 mmol) and DBU (31 µL, 0.21 mmol) were added and the solution stirred at 0 °C for 4 h. After warming to room temperature, the solvent was removed under reduced pressure and the residue obtained was purified via flash chromatography (hexane–EtOAc 6:1) to give imidate 7 as a colourless oil (0.50 g, 73% yield over 2 steps), which was used immediately. Acceptor 8 (0.21 g, 0.36 mmol) was dissolved in CH₂Cl₂ (mL) containing 4Å molecular sieves (2 x 100 mL), dried (MgSO₄) and evaporated. The oil obtained was then dissolved in dry CH₂Cl₂ (20 mL) and cooled to 0 °C. Trichloroacetimidate 7 (0.50 g, 0.19 mmol) in CH₂Cl₂ (10 mL). Stirring was continued for 20 min and then triethylamine (5 mL) was added. The mixture was filtered through Celite, the filtrate concentrated and the resulting residue was purified by chromatography (hexane–EtOAc, 4:1). The pure product (10 mL) was obtained as a colourless oil (0.48 g) in 88% yield. ¹H NMR (500 MHz): 8.07–8.01 (4H, m, ArH), 7.63–7.60 (1H, m, ArH), 7.52–7.46 (4H, m, ArH), 6.95–6.93 (2H, m, ArH), 5.85–5.77 (1H, m, CH=CH₂), 5.57 (1H, d, J 3.2 Hz, H-4′), 5.54 (1H, dd, J 8.1, 10.2 Hz, H-2′), 5.19 (1H, d, J 3.4 Hz, H-1′′), 5.03 (1H, d, J 11.1 Hz, PhCH₂), 4.93–4.88 (3H, m, H-1′, PhCH₂), 4.76 (1H, d, J 11.5 Hz, PhCH₂), 4.74 (1H, d, J 11.1 Hz, PhCH₂), 4.71–4.65 (3H, m, H-1, PhCH₂), 4.50–4.48 (2H, PhCH₂), 4.44 (1H, d, J 11.8 Hz, PhCH₂), 4.32–4.30 (4H, m, H-1, H-6′, PhCH₂), 4.27–4.24 (1H, m, H-6′), 4.17 (2H, d, J 6.8 Hz, PhCH₂), 4.01 (1H, dd, J 3.3, 10.2 Hz, H-3′), 3.97–3.92 (2H, m, H-2′′, H-5′), 3.88 (1H, td, J 6.5, 9.5 Hz, OCH₃(CH₂)₂CH = CH₂), 3.84 (1H, t, J 6.5 Hz, H-6′), 3.66–3.58 (5H, m, H-6, H-5′′, H-4, H-3, H-3′′), 3.47 (1H, dt, J 6.8, 9.5 Hz, OCH₃(CH₂)₂CH=CH₂), 3.43–3.40 (2H, m, H-2, H-6′′), 3.32 (1H, ddd, J 1.9, 4.3, 9.8 Hz, H-5), 3.20–3.17 (2H, m, H-4′′, H-6′′), 2.06–2.02 (2H, m, OCH₂(CH₂)₂CH=CH₂), 1.86 (3H, s, OC(O)CH₃), 1.65–1.61 (2H, m, OCH₂(CH₂)₂CH=CH₂), 1.41–1.26 (6H, m, OCH₂(CH₂)₂CH=CH₂). ¹³C NMR (125 MHz): 169.9, 165.4, 164.4, 126.3–138.8, 113.9, 103.3, 103.2, 100.3, 93.5, 83.7, 82.4, 81.4, 81.3(8), 78.3, 75.2, 74.9, 74.6, 74.5(7), 74.4, 74.3, 74.1, 74.0, 73.3, 73.1, 72.9, 72.8, 71.7, 71.3, 71.2(7), 70.6, 70.0, 69.8, 69.5, 69.4, 68.9, 53.1, 29.4, 29.3, 28.6, 28.5, 28.4(6), 25.7, 25.6, 20.1. HRMS-ESI (m/z) calcd for C₉₁H₉₈O₁₉Na: 1517.6595. Found [M + Na]⁺ 1517.6600.

7-Octen-1-yl 2,3,4,6-tetra-O-benzyl-α-D-galactopyranosyl-(1→3)-4-O-acetyl-2,6-di-O-benzoyl-β-D-galactopyranosyl-(1→4)-2-azido-2-deoxy-3,6-di-O-benzyl-β-D-glucopyranoside (11). The reaction was carried out as described for the preparation of 10 using acceptor 9 and trichlorooacetimidate 7 to provide 11 in 85% yield. ¹H NMR (500 MHz): 8.07–8.01 (4H, m, ArH), 7.63–7.60 (1H, m, ArH), 7.52–7.46 (4H, m, ArH), 6.95–6.93 (2H, m, ArH), 5.85–5.77 (1H, m, OCH₂(CH₂)₂CH=CH₂), 5.54 (1H, d, J 3.4 Hz, H-4′), 5.50 (1H, dd, J 8.0, 10.0 Hz, H-2′), 5.14 (1H, d, J 3.4 Hz, H-1′′), 5.02 (1H, d, J 11.1 Hz, PhCH₂), 4.99–4.90 (2H, m, OCH₂(CH₂)₂CH=CH₂), 4.82–4.72 (3H, m, H-1′, PhCH₂), 4.66–4.60 (3H, m, H-1, PhCH₂), 4.49 (1H, d, J 11.8 Hz, PhCH₂), 4.44–4.40 (2H, m, PhCH₂), 4.31–4.26 (4H, m, PhCH₂), 4.15–4.01 (3H, m, PhCH₂), 3.98–3.89 (3H, m, H-2′′, H-5, H-6), 3.82–3.78 (2H, m, OCH₂(CH₂)₂CH=CH₂),
7-Octen-1-yl 2,3,4,6-tetra-O-benzyl-α-D-galactopyranosyl-(1→3)-4-O-acetyl-2,6-di-O-benzyl-β-D-galactopyranosyl-(1→4)-2-N-acetamido-2-deoxy-3,6-di-O-benzyl-β-D-glucopyranoside (12). Compound 10 (0.44 g, 0.31 mmol) was dissolved in pyridine (4 mL), thioacetic acid (2 mL) was added and the mixture was stirred at room temperature for 24 h. The solvent was then removed in vacuo and the residue purified via column chromatography (hexane- EtOAc 1:1) to give 12 as a colourless oil (0.37 g, 83% yield). \(^1\)H NMR (500 MHz, CDCl\(_3\)): 8.07–8.00 (4H, m, ArH), 7.63–7.60 (1H, m, ArH), 7.53–7.49 (1H, m, ArH), 7.47–7.44 (2H, m, ArH), 7.37–7.21 (33H, m, ArH), 7.16–7.14 (2H, m, ArH), 6.01 (1H, d, J 8.0, 10.5 Hz), 5.60 (1H, d, J 5.5 Hz), 5.03–4.93 (2H, m), 4.79–4.62 (7H, m, PhCH₂), 3.97–3.95 (2H, m), 3.90 (1H, t, J 8.5, 9.5 Hz), 3.00 (1H, m), 2.07–2.01 (5H, m, OCH(OC)CH₃). 1.88 (3H, s, OC(O)CH₃). 1.46–1.38 (2H, m, OCH₂(CH₂)₃CH=CH₂), 1.36–1.17 (6H, m, OCH₂(CH₂)₃CH=CH₂). \(^13\)C NMR: 170.2, 170.1, 165.9, 165.5, 138.60, 138.57, 138.5, 138.11, 138.08, 133.4, 133.3, 127.4–129.8, 114.2, 100.5, 99.6, 94.0, 78.8, 77.3, 76.4, 76.2, 74.6, 73.6, 73.4, 73.1, 72.7, 71.6, 71.3, 71.2, 69.9, 69.4, 69.3, 64.3, 61.7, 33.7, 29.4, 28.9, 25.8, 23.4, 20.5. 7-Octen-1-yl α-D-galactopyranosyl-(1→3)-β-D-galactopyranosyl-(1→4)-β-D-glucopyranoside (13). Compound 10 (100 mg, 66.9 μmol) was dissolved in THF (2 mL) containing CH₃OH (100 μL). The resulting solution was added to liquid ammonia (~5 mL) containing Na metal at –78 °C. After 1 h, CH₃OH (5 mL) was added to the reaction mixture, the ammonia was blown off using a stream of air and the solution evaporated to dryness. The residue was taken up in CH₃OH (50 mL), filtered and evaporated. The residue was subjected to C18 chromatography, using gradient elution (100% H₂O → 50:50 H₂O–CH₃OH) to give 13 as a white solid (40 mg, 97% yield). \(^1\)H NMR (500 MHz, CD₃OD): 5.85–5.77 (1H, m, OCH₂(CH₂)₃CH=CH₂), 5.02 (1H, d, J 1.8 Hz, H-1′′′), 5.00–4.83 (2H, m, OCH₂(CH₂)₃CH=CH₂), 4.41 (1H, d, J 7.3 Hz, H-1′), 4.27 (1H, d, J 7.8 Hz, H-1), 4.21 (1H, app t, J 6.5 Hz H-5′′′), 4.03 (1H, d, J 1.8 Hz), 3.91–3.50 (15H, m), 3.38 (1H, m), 3.23 (1H, dd, J 8.1, 8.6 Hz, H-2), 2.07–2.02 (2H, m, OCH₂(CH₂)₃CH=CH₂), 1.62–1.59 (2H, m, OCH₂(CH₂)₃CH=CH₂), 1.43–1.29 (6H, m, OCH₂(CH₂)₃CH=CH₂). \(^13\)C NMR: 142.6, 117.3, 107.7, 105.3, 100.3, 83.9, 82.6, 79.1, 76.8, 74.8, 73.9, 73.7, 73.6, 73.1, 72.7, 69.2,
65.3, 65.0, 59.3, 37.4, 33.2, 32.7, 32.5, 29.5, 25.5. HRMS-ESI (m/z) calcd for C_{26}H_{46}O_{16}Na: 637.2678. Found [M + Na]^+ 637.2677.

7-Octen-1-yl α-d-galactopyranosyl-(1→3)-β-d-galactopyranosyl-(1→4)-β-d-2-deoxy-2-acetamidoglucopyranoside (14). The deprotection carried out as described for the preparation of 13, starting from 12 to yield 14 in 85% yield. $^1$H NMR (500 MHz, CD$_3$OD): 5.85–5.77 (1H, m, OCH$_2$(CH$_2$)$_2$CH=CH$_2$), 5.02 (1H, d, J 1.8 Hz, H-1’’'), 5.00–4.83 (2H, m, OCH$_2$(CH$_2$)$_2$CH=CH$_2$), 4.45 (1H, d, J 7.1 Hz, H-1’), 4.40 (1H, d, J 8.2 Hz, H-1), 4.21 (1H, app t, J 6.1 Hz H-5’’'), 4.02 (1H, d, J 2.5 Hz), 3.93–3.57 (15H, m), 3.45 (1H, m), 3.37 (1H, m), 3.31 (1H, dd, J 6.0 Hz, 9.5 Hz), 3.00 (1H, m), 2.06–2.02 (2H, m, OCH$_2$(CH$_2$)$_2$CH=CH$_2$), 1.95 (3H, s, OC(O)CH$_3$), 1.55–1.50 (2H, m, OCH$_2$(CH$_2$)$_2$CH=CH$_2$), 1.41–1.28 (6H, m, OCH$_2$(CH$_2$)$_2$CH=CH$_2$). $^{13}$C NMR: 142.6, 117.3, 107.7, 105.3, 100.3, 83.9, 82.6, 79.1, 76.8, 74.8, 73.9, 73.6, 73.1, 72.7, 69.2, 65.3, 65.0, 59.3, 37.4, 33.2, 32.7, 32.5, 29.5, 25.5. HRMS-ESI (m/z) calcd for C$_{28}$H$_{46}$N$_{10}$O$_{16}$Na: 678.2944. Found [M + Na]^+ 678.2932.

8-[(2-Aminoethyl)thio]-1-octyl α-d-galactopyranosyl-(1→3)-β-d-galactopyranosyl-(1→4)-β-d-glucopyranosyl hydrochloride (15). Alkene 13 (12 mg, 0.020 mmol) and cysteamine hydrochloride (17 mg, 0.15 mmol) were placed in a quartz tube and dry CH$_3$OH (0.5 mL) added. The solution was degassed and the tube irradiated with UV light for 2 h. The solution was then evaporated and subjected to C$_{18}$ column chromatography, gradient elution (100% 0.5% aqueous AcOH → 50:50 H$_2$O–0.5% aqueous AcOH) to give 15 as a white solid (13 mg, 90% yield). $^1$H NMR (500 MHz, CD$_3$OD): 5.02 (1H, d, J 1.8 Hz, H-1’’’), 4.41 (1H, d, J 7.1 Hz, H-1’), 4.28 (1H, d, J 7.8 Hz, H-1), 4.21 (1H, app t, J 6.1 Hz, H-5’’’), 4.03 (1H, d, J 1.6 Hz), 3.93–3.47 (16H, m), 3.42–3.37 (1H, m), 3.23 (1H, t, J 8.3 Hz, H-2), 3.09 (2H, t, J 6.8 Hz, S(CH$_2$)$_2$NHCl), 2.77 (2H, t, J 6.8 Hz, S(CH$_2$)$_2$NHCl), 2.57 (2H, t, J 7.3 Hz, CH$_3$S(CH$_2$)$_2$NHCl), 1.61–1.51 (4H, m, OCH$_2$(CH$_2$)$_2$CH$_2$S), 1.42–1.32 (6H, m, OCH$_2$(CH$_2$)$_2$CH$_2$S). $^{13}$C NMR: 105.1, 104.1, 88.7, 81.0, 80.0, 76.7, 76.5, 74.8, 72.3, 71.4, 71.2, 70.2, 66.7, 62.8, 62.4, 40.0, 36.6, 33.1, 32.7, 32.5, 31.3, 30.6, 30.7, 30.3, 30.2, 29.7, 27.0, 23.0. HRMS-ESI (m/z) calcd for C$_{28}$H$_{46}$N$_{10}$O$_{16}$S: 692.3158. Found [M + H]^+ 692.3149.

8-[(2-Aminoethyl)thio]-1-octyl α-d-galactopyranosyl-(1→3)-β-d-galactopyranosyl-(1→4)-β-d-2-deoxy-2-acetamido glucopyranosyl hydrochloride (16). The photochemical addition was carried out as described for the preparation of 15 starting from 14, providing 16 in 97% yield. $^1$H NMR (500 MHz, CD$_3$OD): 5.03 (1H, br s, H-1’’’), 4.42 (1H, d, J 6.9 Hz, H-1’), 4.38 (1H, d, J 6.3 Hz, H-1), 4.21 (1H, t, J 6.0 Hz H-5’’’), 4.03 (1H, br s), 3.93–3.47 (17H, m), 3.42–3.37 (1H, m.), 3.09 (2H, t, J 6.8 Hz, S(CH$_2$)$_2$NHCl), 2.77 (2H, t, J 6.8 Hz, S(CH$_2$)$_2$NHCl), 2.57 (2H, t, J 7.3 Hz, OCH$_2$(CH$_2$)$_2$CH$_2$S), 1.96 (3H, s, C(O)CH$_3$), 1.61–1.51 (4H, m, OCH$_2$(CH$_2$)$_2$CH$_2$S), 1.42–1.32 (6H, m, OCH$_2$(CH$_2$)$_2$CH$_2$S). $^{13}$C NMR: 105.1, 102.8, 97.8, 81.4, 80.0, 76.7, 76.6, 74.3, 72.3, 71.4, 71.7, 71.1, 70.7, 70.1, 66.7, 62.8, 62.5, 62.4(8), 62.1, 56.7, 40.0, 32.5, 30.6, 30.5, 30.3, 30.2, 29.7, 27.0, 23.0. HRMS-ESI (m/z) calcd for C$_{30}$H$_{57}$N$_2$O$_{16}$S: 733.3423. Found [M + H]^+ 733.3422.

6-[(2-[6-(α-d-Galactopyranosyl-(1→3)-β-d-galactopyranosyl-(1→4)-β-d-glucopyranosyl-oxy)octyl]thio][ethyl]amino]-6-oxo-hexanoic acid p-nitrophenyl ester (1). Compound 15 (6
mg, 8.2 μmol) was dissolved in CH₃OH (10 mL) and treated with Amberlite IRA 400 (HO⁻ form) to convert the hydrochloride salt to the amine. The solution was then filtered, concentrated and dried under vacuum. The residue was then dissolved in dimethylacetamide (1 mL) and treated with di-p-nitrophenyl adipate (12 mg, mmol). The solution was stirred for 4 h, then evaporated at 35 °C under high vacuum. The resulting residue was purified using C₁₈ column chromatography, gradient elution (100% 0.5% aqueous AcOH → 50:50 H₂O–0.5% aqueous AcOH) to give 1 (7 mg, 90% yield), which was lyophilized in 0.5% aqueous acetic acid to give a white solid. 

1H NMR (500 MHz, CD₃OD): 8.28 (2H, d, J 9.1 Hz), 7.36 (2H, d, J 9.1 Hz), 5.02 (1H, br s, H-1), 4.78 (1H, d, J 3.4 Hz), 4.48 (1H, d, J 7.5 Hz), 4.20 (1H, t, J 6.0 Hz), 3.90–3.51 (15H, m), 3.50–3.31 (4H, m), 2.66 (2H, t, J 7.0 Hz, S(CH₂)₂N), 2.61 (2H, t, J 6.9 Hz, S(CH₂)₂N), 2.52 (2H, t, J 7.3 Hz, PNPOC(O)CH₂), 2.24 (2H, t, J 6.9 Hz, NC(O)CH₂), 1.89–1.79 (4H, m, PNPOC(O)CH₂(CH₂)₂), 1.59–1.53 (4H, m, OCH₂(CH₂)₃CH₂S), 1.41–1.29 (6H, m, OCH₂(CH₂)₃CH₂S). HRMS-ESI (m/z) calcd for C₄₀H₆₄N₂O₂₁SNa: 963.3614. Found [M + Na]⁺ 963.3617.

6-[[2-[[8-(α-d-Galactopyranosyl-(1→3)-β-d-galactopyranosyl-(1→4)-β-d-2-deoxy-2-acetamidoglucopyranosyloxy)octylthio]ethyl]amino]-6-oxo-hexanoic acid p-nitrophenyl ester (2). Prepared as described for the preparation of 1 starting from 16, giving 2 in 90% yield as a white solid. 

1H NMR (500 MHz, CD₃OD): 8.28 (2H, d, J 9.1 Hz), 7.36 (2H, d, J 9.1 Hz), 5.02 (1H, br s, H-1), 4.42 (1H, d, J 7.3 Hz), 4.39 (1H, d, J 8.1 Hz), 4.20 (1H, t, J 6.0 Hz), 3.90–3.51 (15H, m), 3.52–3.31 (4H, m), 2.66 (2H, t, J 7.0 Hz, S(CH₂)₂N), 2.61 (2H, t, J 6.9 Hz, S(CH₂)₂N), 2.52 (2H, t, J 7.3 Hz, PNPOC(O)CH₂), 2.24 (2H, t, J 6.9 Hz, NC(O)CH₂), 1.96 (3H, s, C(O)CH₃), 1.89–1.79 (4H, m, PNPOC(O)CH₂(CH₂)₂) 1.59–1.53 (4H, m, OCH₂(CH₂)₃CH₂S), 1.41–1.29 (6H, m, OCH₂(CH₂)₃CH₂S). HRMS-ESI (m/z) calcd for C₄₀H₇₆N₃O₂₁SNa: 1004.3880. Found [M + Na]⁺ 1004.3877.
