Introduction

On New Year’s Eve 2016, the Cologne Police Department proudly reported via Twitter that it was currently screening hundreds of “nafris” at the main train station in Cologne. The label ‘nafrī’, used by the police to refer to North Africans, had its (public) linguistic debut in this tweet, which was immediately followed by national moral outrage. Later, when justifying the department’s choice of words, the police chief claimed that “[i]t is undeniable that there is an accumulation of criminal acts by persons from North African areas, and we needed to find a police-internal term for that”. So what were people so upset about? The police department introduced a term that functions to convey a causal link between membership in the social category of North Africans and criminal behavior. In other words, they introduced a term that negatively essentialized its targets: It doesn’t only attribute criminal behavior to the group, it also says that members of the group have this trait in virtue of some North-African “nature”. It is as if ‘nafrī’ says: “there is something about North-Africans that makes them criminal”. This, as I will here argue, is the key semantic characteristic of slurs. As I see it,

1. Special thanks to Robin Jeshion, Mark Schroeder, and Guillermo Del Pinal for various rounds of comments on earlier drafts of the paper and extremely helpful conversations on its topic. Thanks also to Gretchen Ellefson, Jennifer Foster, Paul Garofalo, John Hawthorne, Frank Hong, Caley Howland, Gabrielle M. Johnson, Zawi Johnson King, Renee Jorgensen Bolinger, Brian H. Kim, Junhyo Lee, Ben Lennertz, Alex Mavda, Rachel McKinney, Daniel Pallies, Quyen Pham, Jack Samuel, Henry Schiller, Scott Soames, David Wallace and two anonymous reviewers for very helpful comments on earlier versions of the paper. I presented versions of this paper at USC, Cal Poly Pomona, the University of Michigan, the ECAP.9 in Munich, the 2017 Pacific APA meeting, the 2017 ESPiP meeting, the 2017 SPP meeting, the Athena in Action 2018, and the GAP.10 in Cologne. I am grateful to those audiences for helpful discussions.

slurs are kind terms encoding an “essence” of a social group, which is taken to explain a number of negative features attributed to the group. In effect, then, the police department introduced a slur for people from North African countries into the German language community, and people were rightly upset about it.

The main aim of this paper is to introduce to the philosophical debate an essentialist theory of slurs that has, to my knowledge, not yet been given adequate consideration. The main thesis of this paper is that slurs are a species of failed kind terms; they are terms which, although introduced with the intention of designating kinds, fail to do so. All recognized properties of slurs are derivable from this simple semantic base; no additional linguistic entities need to be posited to account for the special features of slurring vocabulary. Although the primary goal of this paper is to motivate an essentialist semantics of slurs rather than to defeat theoretical alternatives, it is worth mentioning that I take my essentialist model to have a central virtue that makes it stand out from competing theories. Namely, that it can account for the acknowledged desiderata of an adequate semantics of slurs while receiving strong support from empirical work in cognitive psychology.

In what follows, I assume a theory of natural kind terms according to which they encode an essence of a kind, k, that is explanatorily connected to a set of stereotypical features associated with k. This way of carving out the semantics of natural kind terms differs slightly from the classical Kripkean framework of natural kind terms. Since I take descriptive information about stereotypical features to be part of the lexical entry of kind terms, I am committed to a conception of lexical representations as informationally rich. However, instead of using this paper to debate foundational issues in lexical semantics, I will here simply assume this framework and show what some of its fruits are. In effect, the police department introduced a slur for people from North African countries into the German language community, and philosophers’ imprint has been given adequate consideration. The main thesis of this paper is to debate foundational issues in lexical semantics, I will here simply assume this framework and show what some of its fruits are.

I begin by giving a detailed outline of my theory. Next, I introduce key linguistic desiderata of a theory of the meaning of slurs, and show that my theory meets all of them. Finally, I present evidence from cognitive psychology and psycholinguistics for my essentialist account.

§1 Slurs as Failed Kind Terms

1.1 The View

The main thesis of this paper is that slurs are akin to natural kind terms. Under the framework of natural kind terms that I am assuming, natural kind terms are introduced to designate an essence that is explanatorily connected to a set of stereotypical features of a kind. Slur terms are distinctive because they designate an essence that is explanatorily connected to a set of negative stereotypical features of a social group. Thus, slurs are a species of kind terms and to be treated semantically on a par with terms such as ‘water’, ‘gold’, or ‘tiger’. Scott Soames (2007) describes natural kind terms such as ‘water’ as introduced by the following schema:

The term ‘water’ is to designate the unique substance of which (nearly) all members of the class of its paradigmatic samples are instances. Substances are explanatory kinds instances of which share the same basic physical
Eleonore Neufeld

An Essentialist Theory of the Meaning of Slurs

constituent, which in turn explains their most salient characteristics—in the case of water samples, the fact that they boil and freeze at certain temperatures, that they are clear, potable, and necessary to life, etc. Hence, the predicate ‘is water’ will apply (at a world-state) to precisely those quantities that have the physical constitution which, at the actual world-state, explains the salient features of (nearly) all paradigmatic water-samples. (Soames, 2007, p. 2)

‘Water’ hence, designates whatever underlying physical characteristic—call it “essence”—is shared by all ‘water’-members and explains and gives rise to the paradigmatic features of water. Similarly, I maintain that the N-word is used to designate a “blackness essence”—whatever that is—which is causally responsible for and explains negative features stereotypically associated with being black. ‘Faggot’ is true of those people who share the “gay essence”—whatever that is—which is causally responsible for and explains stereotypical negative features associated with gay persons. In general, slur concepts encode mini-theories which represent an essence-like element that is causally connected to a set of negatively-valenced stereotypical features associated with a social group. The truth-conditional contribution of slur nouns can then be captured by the following schema: For a given slur S of a social group G and a person P, S is true of P if P bears the “essence” of G—whatever that essence is—which is causally responsible for stereotypical negative features associated with G and predicted of P.

Importantly, the claim is not that there are essences of the kind mentioned. Although slurs are introduced with the intention of designating natural kinds, in most cases, they actually fail to do so. In contrast to ‘water’, ‘gold’ or ‘tiger’, there obviously will be no underlying, unified causal explanation for the set of (often inaccurate) stereotypical features that is supposed to be explained by the essence (see also Appiah, 1985; 1996; Zack, 2002). More concretely, there is no such thing as a “gayness essence” which disposes male homosexuals to carry HIV or dress stylishly. There is no such thing as a “blackness essence” which causes black people to deal drugs or receive welfare. Thus, the semantic contents of slurring words are empty.

I will now break down the structure of slur concepts into three core elements that, according to the view I am advocating here, together constitute a theory-like representation encoded in those concepts. The central element of a slur is the causal component: the intrinsic “hidden unobservable” that explains and gives rise to the superficial, stereotypically observable features and actions of members of the social category in question. It is this causally deep component that we call the “essence”. These “essences” are to be thought of as the intrinsic, “underlying natures that make them the thing that they are” (Medin, 1989, p. 1476), or as an object’s “underlying reality or true nature that one cannot observe directly but that gives an object its identity, and is responsible for other similarities that category members share” (Gelman, 2004, p. 404). Importantly, the essence can, but does not have to be, represented as being biologically grounded. In fact, it does not have to be known what exactly the essence is. Rather, essentialism can be thought of as “a ‘placeholder’ notion: one can believe that a

7. After the term has been introduced into a language community, it is possible that some stereotypes associated with a slur change. For example, at the time of introduction of ‘faggot’, the “gayness essence” wasn’t taken to explain the feature of carrying HIV, a negative stereotypical feature now associated with the slur, since the slur predates the discovery of the virus. In these cases, we simply discover more features to be caused by the essence (just as with other natural kind terms), and update the concept accordingly. Insofar as the updated concept is sufficiently similar, concept identity is preserved (see section 1.3). Note, however, that the focus of this paper is on lexical, not diachronic, semantics. Diachronic phenomena, such as acquisition, lexical transition from non-slurring to slurring meaning, meaning identity over time, or appropriation have to be addressed in a separate paper.

8. In the course of the paper, I often use the terms ‘term’ and ‘concept’ interchangeably. This is because I take the view for granted according to which terms inherit their linguistic meaning directly from internally individuated lexical concepts, which I understand as the smallest constituents of thought and primary bearers of meaning.
category possesses an essence without knowing what the essence is” (Gelman, 2004, p. 404; see also Medin & Ortony, 1989).\(^9\)

The second component comprises stereotype features of the reference group that, in contrast to ordinary natural kind terms, must be represented as negative. These features provide a heuristic for the identification of individuals of the essentialized group. That is, the observable surface features — which are, in the eyes of the racist, xenophobic, or homophobe, dominantly negative\(^10\) — deliver a reliable indicator for the presence of the causally powerful essence. And since they are caused by the essential property in question, it is assumed that members of the class have an inherent disposition to exhibit those features. Thus, it is assumed that most, but not necessarily all, individuals of an

9. Thus, the notion of “essentialism” that I operate with is the one that is used in the literature on psychological essentialism (Gelman, 2003; Haslam et al., 2004; Medin & Ortony, 1989), which, in the philosophical literature, is sometimes referred to as “quintessentialism” (Leslie, 2013).

10. The negativity-aspect of the theory raises an important question: What does it take for a feature to be negative? Generally, I take a quasi-subjectivist stance on this matter: A feature is negative when it is represented as negative by a sufficient number of subjects. Under this conception, negativity is highly context-sensitive. Even if a feature is generally seen as positive or neutral, it can become negative in certain contexts. For example, while +HAVING HIGH SAT SCORES or +DRESSING STYLISHLY are, in and by themselves, positive qualities, they are evaluated as threatening and negative when combined with certain social outgroups as in the first example, or certain genders as in the latter. Similarly, many encoded features, such as skin tone or facial configuration, will be objectively absolutely valence-free, but can either be encoded as proxies for other negative features and thus themselves become represented as negative, or be irrationally encoded as negative in the first place.

A reviewer also pointed out to me that the negativity-aspect of my proposed semantics might create a problem in accounting for sentences such as “I’m hopeless at fashion. I wish I knew some fag who could just tell me how to dress to attract the ladies”, which should come out felicitous under my account, since it is used to ascribe and explain properties the speaker takes to be positive. However, I do not think this is correct. We often use negative properties of others to our favor, as in: “I’m in love with this woman, but she has a husband. I wish I knew some criminal, bad person who could help me get rid of my problem.” This is perfectly coherent, despite the fact that +CRIMINAL or +BAD are negative properties and the speaker represents them to be negative—the speaker just uses these negative properties to his favor. For a persuasive response to a similar objection by Camp (2013), see Jeshion (2018).

An Essentialist Theory of the Meaning of Slurs

essentialized group share one or another subset of those features. But what’s decisive for belonging to the essentialized group is the presence of the shared underlying “essence” or “hidden nature”. This nature causally disposes the subject to exhibit the negative surface features, whether or not they actually display them at any given moment.

As the first and second component don’t stand in an accidental, but in a causal-nomological relation to one another, we need a third semantic component to capture this special relation. This element is a representation of this very causal, law-like relationship. This relationship is crucial for the informational organization of the category that is represented in our concept, since it relates the essence and the stereotypical features of the social reference group in a way that is not merely arbitrary or correlational, but grounded in causal laws.

The immensely derogatory, toxic power of slur terms and their distinctively racist (or xenophobic, homophobic, sexist, etc.) content directly derives from the outlined semantics. When the racist, xenophobe, or homophobe applies a slur, he thereby makes the target in question — and anyone who “shares the same essence” — part of the mini-theory, subjugating her to a form of causal determinism and thereby depriving her of human autonomy and self-determination. How the targets are disposed to act is, in the eyes of the slur user, determined and consequently importantly constrained by the causally potent essence. Members of the targeted group are thus not evaluated by their individual acts or in relation to their environmental circumstances, but by (pre-)determined membership in a group.\(^2\) Crucially, the attributed essence is seen as disposing their bearers to act badly, or to exhibit negative features. Thus, by carrying the relevant “group essence”, a black or gay person is always predisposed to, for example, exhibit certain traits or behaviors — even if all available evidence indicates otherwise. Taken together, it is easy to see how the application of an essentialized

11. See Basu (2019) for a recent argument that epistemically representing others in a way that treats them as scientific objects—i.e., essentializes them—constitutes a case of wrongdoing.
slur term is derogating, demeaning, and dehumanizing to the target and the entire social group she is a member of (cf. fig. 1).

Consider again the analogous behavior of other concepts corresponding to kind terms, e.g., the natural kind concept kangaroo. We know from cognitive and developmental psychology that young children think that kangaroos that grow up with goats will nevertheless be good at hopping. We act as if kangaroos are just made to hop (Gelman, 2004; Gelman & Wellman, 1991). So just as a kangaroo cannot lose its “kangaroohood” if it is raised in a goat family, and is dispositionally “made” to hop even if it doesn’t do so (cf. for an empirical overview Gelman, 2003; 2004), so are the members of the social groups in question not evaluated by their individual circumstances or self-determined acts and decisions. This is precisely what is responsible for the dehumanizing power of slurs, as the attribution of “essences” that pre-determine the target’s dispositions, character traits, attitudes, and behaviors creates a picture of the target according to which she lacks the full spectrum of human autonomy and self-determination that we associate with personhood.  

1.2 Some Helpful Contrasts

One of the most important things to emphasize is that on my view, slur terms are not synonymous with their neutral counterparts. In fact, my account of slurs doesn’t appeal to the meaning of their neutral counterparts at all. ‘Gay’, ‘Jew’, or ‘Hispanic’ are governed by conventions that crucially differ from ‘faggot’, ‘kike’, or ‘spic’. Much research confirms that race concepts are highly essentialized, an issue we will later cover in more detail. But although ‘gay’, ‘Jew’, or ‘Hispanic’ can be represented as socially essentialized categories that “share a common nature” and facilitate (especially negative) generalizations (cf. Dovidio, Glick, & Rudman, 2005; Gelman, 2003; Haslam & Levy, 2006; Haslam, Rothschild, & Ernst, 2000; Hirschfeld, 1996; Leslie, 2017; Pauker, Ambady, & Apfelbaum, 2010; Prentice & Miller, 2007), the meaning of the nouns that refer to those categories is still much more innocuous, both with regard to its causal determinism and the stereotypes they encode.

First, even if we say that slurs’ neutral counterparts are sometimes essentialized, I contend that the essence referred to by, say, ‘chink’ is not identical to the essence of ‘Chinese’. Also under the assumption that ethnic labels sometimes function as kind terms, the kind they designate differs from the kind their closest slur-relative designates. I merely chose ‘Chinese essence’ as a label for the essence placeholder that unifies, in the eyes of the racist, the alleged referents of the slur; I could as well have called it ‘chinkness essence’. Second, even persons whose representation of races or ethnicities is very essentialized do
not have to conceptualize these racial essences as causally linked to negative properties in order to be competent with the race or ethnicity terms. They can believe in a “hidden nature” of races while not believing that the features caused by this nature are mostly negative. Thirdly, the convention governing, e.g., racial terms generally permits higher degrees of causal innocence than the linguistic conventions governing slur terms. This means that it is not necessary in order to be competent with the term ‘Chinese’ to encode that instances of this kind share a causal essence that pre-disposes them to behave in negative ways. It is possible to refer to people with a Chinese background in a neutral manner that does not essentialize them. In fact, many contexts require even the racist or homophobe to be aware of a non-essentialist convention that is endorsed in the case of racial, ethnic, or sexual vocabulary.13

To explain the mechanics of my view, it is helpful to draw contrasts to some other, superficially similar, views. My account bears similarities to the hybrid family-resemblance account by Adam Croom (2011; 2014a; 2015) and the perspectival account by Elisabeth Camp (2013; 2018). According to Croom, slurs contain both an expressive and a descriptive component, the latter of which consists of a list of weighed prototypical features. Since the prototypical features encoded by slurs and their neutral counterparts differ, it follows that they are not truth-conditionally equivalent. Although my account, like Croom’s, treats slurs as informationally rich, there are a number of important differences between them. Under my account, slurs do not merely encode

13. Consider, for instance, the conventions governing legal contexts. Here, occurrences of social group terms such as ‘homosexual’ have a purely descriptive meaning whose referents can be determined by a fixed set of criteria. In this case, it would be something akin to ‘everyone that has same-sex preferences or engages in same-sex behavior’. As a result, a racist or homophobe would have to comprehend the neutral-descriptive meaning attached to the neutral counterparts in order to be competent with the terms. In contrast, to fully master a slur word, “successful application” requires one to tacitly understand the causal story between some essence and negative stereotypes that I here outlined. In contrast to the convention of their neutral counterparts, the convention governing slurs does not leave open the possibility of a causally-neutral application.

feature lists; rather, they encode information in a way that is causally organized. In particular, slurs relate prototypical features nomologically to causally powerful essences.14 As we will see in the next sections, the causal elements explanatorily differentiate my account from Croom’s, for they lead to a number of distinct linguistic and psychological predictions about phenomena such as derogatory variation, essentialism about social groups, or nominalization. Most importantly, the causal elements play a crucial role in ensuring that slurs will come out as empty, as there is and will be no “deep essence” that explains features associated with a group, even if the stereotypes, due to effects of structural disadvantages, might accurately represent certain members of oppressed groups.15

According to Camp’s perspectival account of slurs, “slurs make two distinct, coordinated contributions to a sentence’s conventional communicative role: a truth-conditional predication of group membership, and endorsement of a derogating perspective on that group” (Camp, 2018, p. 30). In virtue of the second speech-act, a speaker signals their allegiance to a perspective16 according to which the target’s group membership is explanatory of many of her other properties, and predicts the
display of negative stereotypical properties. This second speech-act is similar in spirit to the semantics I propose here.

Despite these similarities, there are key differences between our accounts. Perhaps most importantly, I only posit one, purely predicative, speech-act to explain the semantics of slurs. As the pure truth-conditional attribution of neutral counterpart group membership doesn’t play any role on my account, Camp’s first, predicational speech-act comes out as explanatorily redundant on my account. As a result of this difference, the accounts diverge with regard to some key linguistic predictions, which we will assess in the next section. As with Croom, one of the crucial predictive differences is that predications of slurs always come out false under my account, whereas they often come out as true for the predicative speech-act component of Camp’s account.17

But also the second, perspectival speech-act does not do what slurs do under my construal. According to Camp’s characterization of this second speech-act, “slurs are akin to other expressions [like ‘tu’/‘vous’ or slang expressions for parents, food, or genitals], part of whose conventional function is not merely to refer or predicate, but to signal the speaker’s social, psychological, and/or emotional relation to that semantic value” (Camp, 2013, p. 335); thus, slurs contribute “a (broadly) expressive, perspectival element to the conversation” (my emphasis; Camp, 2018, p. 48). The latter quote is instructive: The second speech-act is broadly expressive, because it is about the speaker’s perspective on a referent. In contrast, although they can reveal something about my perspective — just as calling a chair “sofa” can reveal something about my perspective on the chair — slurs are not about perspectives on my account. In my view, slurs’ meaning is predicative in the full-fledged, traditional sense. What slurs say of you is that you have some group essence that disposes you to display bad features; thus, a slur-predication will be either true or false of you. It is precisely because of the purely predicative function that slurs come out as empty.

1.3 Objections
Before we move on, let me respond to a salient objection against the proposed model, namely that it is too informationally demanding for competent language speakers. Two worries of this type seem particularly concerning. First, two people can plausibly employ a slur in communication without talking past each other, although each of them associates different stereotypes with it. Second, someone can be competent with a slur without knowing the stereotype associated with it. In the slurs literature, these worries have been spelled out by Robin Jeshion and Elisabeth Camp (Camp, 2013; Jeshion, 2013b). However, it is important to bear in mind that they are in fact versions of familiar, more general worries about rich views of lexical meaning that often come up outside of the slurs debate, such as in discussion of inferential role or prototype theories of concepts (Fodor, 1998; Fodor & Lepore, 1992; Rey, 1983).

The main goal of this paper is to assume a specific account of lexical meaning as richly structured and argue that it helps us explain certain patterns that are unique to slurs. The background semantic framework I assume is a live option in current debates about the nature of meaning and conceptual structure.18 So although I will briefly respond to the objections that have come up against treating slurs along these lines, the appropriate locus for a full response to these objections is in another paper discussing the general viability of this approach to meaning and concepts.

17. Another difference is that Camp explicitly rejects that slurs, generally, conventionally encode stereotypes. However, because she suspects that some slurs do encode stereotypes, I will treat this difference as not too important (see Camp, 2013).

A number of philosophers and cognitive scientists have presented convincing replies to the first worry (see, e.g., Chomsky, 2000; Harman, 1993; Marconi, 1997; Smith, Medin, & Rips, 1984). Their strategy emphasizes that, holding the level of competence fixed, similarity of conceptual content is all we need to explain the stability of meaning between different speakers, and, for that matter, communicative success. More concretely, if the mental concepts that two speakers associate with a word are sufficiently similar, we would expect that information exchange, in most cases, proceeds smoothly. Appealing to high similarity instead of strict identity also explains the fact that we sometimes miscommunicate or are in disagreement about the extension of a given term in borderline cases. If the meaning of every word type was strictly identical between each competent speaker, these phenomena would become a mystery. Thus, modeling meaning stability in terms of content similarity allows for communicative success and exceeds the descriptive accuracy of a strict identity view. This point can directly be applied to slurs. Due to similarity of content, communication will proceed “smoothly” in most cases. Only in rare borderline cases, communication between two subjects might be unsuccessful.

Let us turn to the second worry. Is it possible to be competent with the meaning of a slur and not have knowledge of any associated stereotype? According to Jeshion, someone can coherently and competently utter

(1) “I disdain those queers; anyone who would do that is sick. But I do not endorse those [stereotypes] as the right way of thinking about queers. I have no idea who does

19. This point is quite important and often neglected in discussions of conceptions of meaning that appeal to stereotypes. It belongs to the operationalization of a stereotype that it is highly stable: Something is a stereotype only if it is highly stable in a population. If there was no cross-subject stability, we would not call a given property a stereotype. Relatedly, if stereotypes allowed for high variability, we would not get reliable and replicable effects in experimental paradigms and hence wouldn’t be able to find any stereotype effects in controlled settings—but we do. Also detrimental phenomena such as the stereotype threat would not be very worrisome if the associations triggered were as variable across subjects as is suggested by the objection.

An Essentialist Theory of the Meaning of Slurs

it, what they are like, and I don’t care. I just think those queers should be locked up.” (Jeshion, 2013b, p. 322)

Assuming that the intuition Jeshion capitalizes on is generalizable, the essentialist theory has the resources to account for it. The speaker in (1) has to do quite some work and introduce a variety of qualifications to get their intended, minimal meaning of ‘queer’ across. Although the speaker rejects many stereotypes, one surface property that the speaker regards as highly negative is left, which they make salient through “anyone who would do that is sick”. According to my theory, the context of utterance makes it clear that the speaker means to pick out someone who bears the “queerness essence”, which makes the person inherently sick and causally explains the property of same-sex behavior, which, in the eyes of the speaker, is clearly negative. And although we can make sense of this contextually modified case in a way fully compatible with the essentialist theory, the standing meaning of ‘queer’ will still be one that fully corresponds to the semantics I propose — i.e., one in which more than only the minimal stereotype is communicated.

20. As has been pointed out before (Camp, 2013), it is unclear how uniform the intuitions about (1) are, and thus whether our theory should accommodate this data point. I, for one, have extreme difficulties making sense of (1), especially if schematically replaced with other slurs. Here’s one reason that might explain my difficulty. It seems to be a true generalization that slurs emerge in communities that interact with the people they are slurring. This is why slurs are often fairly meaningless to people who are from cultures or communities that are not in touch with the slurred group in question. But if this is true, it will also be true that, due to interaction with slurred groups, these communities and competent users within them will have stereotypes of these members. It is therefore fairly difficult to imagine that anyone who is competent with a slur could utter something like (1). Notice that Jeshion herself goes on to explain that “[m]uch racism and bigotry is rooted simply on finding others ‘different’—often because of physical characteristics” (p. 322). Different or +physical characteristic C, however, are stereotypical properties of the same status as the stereotypes Jeshion dismisses as semantically encoded (e.g., +sexually promiscuous).

21. And possibly a number of other negative properties that the speaker leaves open.
Drawing on Putnam's division of linguistic labor (Putnam, 1975), we can furthermore appeal to partial linguistic competence and deference to experts to accommodate Jeshion’s worry. Can we say of Putnam that he is linguistically competent with the word ‘elm’, even if his associated prototypes of ‘elm’ and ‘beech’ are identical? In some sense, yes: He knows that ‘elm’ is a natural kind term and designates some “elm essence” that explains common properties of elms. He will not be at total loss in linguistic discourse about elms, and he will have an idea about the reference of the term when elms are nearby. He himself will also be able to apply the term correctly in many circumstances. However, Putnam also knows that there are degrees of competence, and that there are ‘elm’ experts in his linguistic community whose referential and inferential competence with the term exceeds his. Thus, Putnam is disposed to take the ‘elm’ expert as a linguistic authority when the circumstances require, and revise his concept in accordance with the expert’s more fine-grained one. Although Putnam can be said to be competent with the word ‘elm’, he certainly does not have the expert’s degree of linguistic competence.

This point can be applied to (1). Suppose that a speaker is ignorant of the stereotype speakers associate with the slur. All she knows is that it is used towards people with the surface property +HOMOSEXUAL. Can we say that she is competent with the slur? Again, in some sense, yes. Since she knows that the term is a slur, she knows that it denotes an essence that must explain the feature +HOMOSEXUAL and some other features. Thus, in many circumstances, she will be able to use the term appropriately, including to draw the right inferences from it and pick out its intended referents. But again, since competence comes in degrees, we wouldn’t say that the speaker is fully competent: There will be situations in which she will be confused about the referent of the word — for example, in cases in which the intended referent of a more competent user does not engage in same-sex behavior, but exhibits other stereotypes that license inference to the essence. Since the speaker also knows that there are “experts” of the term in their linguistic community, she will be disposed to update her entry for the slur if she takes her interlocutors to be linguistic authorities.

§2: Slurs in Natural Language

Having presented the view, I will now demonstrate its explanatory reach. Slurs exhibit unique linguistic patterns that have proven difficult to capture. However, since these data are acknowledged as explanatorily central for a successful theory of slurs, any adequate account must have the resources to explain them. The data include: (1) G-extending, (2) G-contracting, and (3) G-referencing uses of slurs (Croom, 2015; Jeshion, 2013a), (4) non-derogatory, non-appropriated uses of slurs (Hom, 2008; Jeshion, 2013a), (5) intuitions about null-extension and falsehood (Hom, 2008; Hom & May, 2013; Richard, 2008; Sennet & Copp, 2015), (6) projection behavior (Anderson & Lepore, 2013; Camp, 2013; 2018; Cepollaro & Stojanovic, 2016; Jeshion, 2013b; Potts, 2007) and (7) derogatory variation of slurs (Bolinger, 2017; Hom, 2008; Jeshion, 2013a; Nunberg, 2018; Popa-Wyatt, 2016). In what follows, I will go through these linguistic phenomena and demonstrate that the essentialist theory can handle them in a direct, non-stipulative way.

(i) G-extending Uses of Slurs

Imagine the following sentence as uttered by a high school student to describe his classmate John, who doesn’t like sports and has interests in art:

(2) “John is not gay, but he is still a faggot.”

Similarly, we can imagine another high school student rejecting (3a), yet accepting (3b):

(3) a. “John is gay.”

b. “John is a faggot.”

The first thing to notice here is that intuitively, it seems to be perfectly
possible to utter (2) (or to disagree to (3a) yet accept (3b), for that matter)—intuitively, it does not express any contradiction. However, if ‘gay man’ and ‘faggot’ were truth-conditionally equivalent, as is defended in many prominent accounts on slurs, (2) should express a semantic contradiction that can only be “rescued” pragmatically. For example, Anderson and Lepore’s minimalist analysis treats slurs’ semantic content to be exhausted by the truth-conditional content of the neutral counterpart (Anderson & Lepore, 2013). Also, Jeshion’s expressivist account treats slurs’ truth-conditional contribution to be equivalent to the truth-conditional contribution of the neutral counterpart; an expressive element of contempt is added to account for the derogatory properties of slurs (Jeshion, 2013a). And as we saw earlier, according to Camp, one of the speech-acts slur users engage in is a pure predication of membership in the neutral counterpart group (Camp, 2013; 2018). Thus, in all these cases, it would not be possible to be in the extension of ‘faggot’ without being in the extension of ‘gay man’.

The second thing to notice is not only that (2) is usually not perceived as a contradiction, but we also have immediate, clear intuitions about the information it conveys. Namely, that John is not in the extension of men with a homosexual orientation, but—probably because he shares salient stereotypical features associated with gay persons, such as talking about “female” topics, being physically “weak”, or dressing stylishly— is in the extension of ‘faggot’.

22. Note that G-extending uses of ‘faggot’ are extremely common. As sociologist C.J. Pascoe notices in her study on masculinity and sexuality in high school, “[a] boy could get called a fag for exhibiting any sort of behavior defined as unmasculine (although not necessarily behaviors aligned with femininity): being stupid or incompetent, dancing, caring too much about clothing, being too emotional, or expressing interest (sexual or platonic) in other guys” (Pascoe, 2012, p. 57).

23. The same point applies to the analyses in Bach (2018); Cepollaro & Stojanovic (2016); Hom (2008); Hornsby (2001); Nunberg (2018); Potts (2004); Schlenker (2007); Sennel and Copp (2015); Whaling (2013), and Williamson (2009), because they either include the meaning of the neutral counterpart into the truth-conditional meaning of a slur, or treat slurs and neutral counterparts as truth-conditionally equivalent (conditional on the existence on a neutral counterpart term—see Nunberg, 2018).

My essentialist theory can handle the examples in (2) and (3) quite smoothly. Consider the homophobe uttering (2). Since in my theory, slurs are not synonymous with their neutral counterparts, a contradiction is not predicted. This would only be so if the application of the slur would entail the application of ‘having homosexual preferences’. But attribution of the slur term does not imply attribution of the neutral counterpart term. Recall fig. 1: +negative stereotype X is only a surface feature of the underlying ‘group essence’ cause. Thus, the deep and hidden ‘gay essence’ and the superficially instantiated feature of homosexual preferences have crucially different causal roles. While it certainly has important stereotypical weight, it is possible to cancel the feature of homosexual preferences, as long as the non-changing “gay essence”, in the eyes of the slur user, “stays present”. This is precisely what happens in (2). The homophobe’s concept of ‘faggot’ encodes a mini-theory, according to which the unobservable causal property of a “gay essence” causes and explains observable, negative features. These stereotypical features, in turn, are the observational heuristics the homophobe uses to “spot” the “gay essence”. Since John presumably exhibits enough of those features, the speaker uttering (2) “efficiently” expresses that John, although not in the extension of gay people, shares some gayness “essence” that causes him to exhibit negative traits correlated with gayness and thus falls under the extension of the slur.

Jeshion (2013a) dubs cases such as the ones in (2) and (3)—in which the slur is applied to a target that doesn’t belong to the group paradigmatically associated with the slur—“G-extending” uses of slurs. Some theorists have tried to explain away G-extending uses by stipulating that they are non-literal (e.g., Anderson & Lepore, 2013; Jeshion, 2013a); therefore, a theory of slurs need not account for these uses. However, none of these theorists has offered an argument that shows that these uses are non-literal. The usual move is to point to...
other cases of metaphorical language-use and assume that these cases and G-extending uses of slurs are parallel. However, whether these uses are parallel is precisely what is at stake — I haven’t yet seen a defense of this claim that establishes, and not simply assumes, that they are.25 In fact, it is no surprise that these theories advocate the non-literality solution; otherwise, G-extending uses would falsify their theories. And although it is not my claim that this strategy is in principle unavailable to debunk the data in (2) and (3), it is important to note that the essentialist theory provides us with a plausible explanation that takes the data at face value and captures them without having to rely on moves that treat G-extending uses as non-literal.26

Note also that G-extending uses of slurs as the one in (2) are commonplace in the everyday language of slur users.27 Their meaning is available immediately and effortlessly, so there is prima facie strong motivation for taking these highly conventional uses to be literal.28 Additional evidence comes from constructions with modifiers and qualifiers such as ‘true’, ‘real’, and ‘deep down’:

(4) “Although Leyla isn’t a socialist, she’s still a true/real commie.”

(5) “Although Jack isn’t Italian, he’s still a true/real dago.”

(6) a. “I know that he’s not gay, but deep down, he’s a faggot.”

b. “I know you haven’t lied, but deep down, you’re a liar.”

Intuitively, taking the slur usages in (4) to (6a) to be non-literal seems implausible. This point is strengthened if we look at the use of ‘liar’ in (6b). In (6b), which parallels (6a), what the speaker is literally accusing me of and is thus accountable for is being, deep down, a liar. To say that ‘liar’ is used in a non-literal sense therefore seems unjustified. Similarly, it is difficult to make sense of the claim that the speaker in (6a) labels someone with the slur in any non-literal way — after all, the speaker claims that this is what the targeted person, deep down, is. The intended meanings of (4)–(6) are furthermore directly available, even though the objects of discourse don’t belong to the neutral counterpart groups in question and the slurs have been combined with modifiers that don’t seem to call for metaphorical readings, such as ‘true’ and ‘real’. These data, while not absolutely decisive, seriously undermine the claim that G-extending are non-literal uses of slurs.

(2) G-contracting Uses of Slurs
In so-called “G-contracting” uses of slurs, the domain of possible targets is contracted: It is made explicit that the range of a slur is not the entire neutral counterpart group that is predominantly associated with a slur (see Jeshion, 2013a):

(7) “I don’t have anything against feminists — in fact, I’m a feminist myself. What I hate are these feminazis.”

(8) “Although my best friend is gay, you can be sure that he’s not a faggot.”

(9) “Thank God! My new neighbors are lesbians, but they are not dykes.”

As with G-extending examples, (7)–(9) are perfectly meaningful, fairly common examples of slur usage.29 As before, a number of accounts...
predict that this type of sentence yields a semantic contradiction, since they subscribe to the view that slurs and their neutral counterpart are truth-conditionally equivalent.\textsuperscript{30} Since slurs and their neutral counterparts are truth-conditionally equivalent, it is not possible to apply the neutral counterpart term to someone while denying that the target belongs to the set denoted by the slurring noun.\textsuperscript{31} According to the essentialist theory, the meaning of slurs and their counterparts is not equivalent. Thus, a slur user can deny that someone has an ‘essence’ that causes negative properties while attributing the bare property of homosexual preferences to him. This is the case if the object of the discourse, in the eyes of the slur user, does not exhibit sufficient surface features that would license the inductive inference to the "gayness essence". And this fits the intuition for (8): While the person under discussion has homosexual preferences, we take the sentence to mean that he will lack many features associated with a "gay nature".

(3) G-referencing Uses of Slurs
In so-called “G-referencing” uses of slurs, the slurred target belongs to the social group that is predominantly associated with the slur in question. These cases are commonly considered the most basic cases of slur usage. (10)–(12) illustrate these G-referencing uses:

(10) “Let’s watch the movie with those cunts in it.”
(11) “Of course, the kraut made me fail the exam.”
(12) “The University of Southern California is full of chinks.”

It is important to show that my theory does not only account for the tricky linguistic cases, but also gets the basic data right. We want to know why the application of slurs to those groups is “licensed”, and why the uses in question are derogatory. According to my theory, in each case, the targets are attributed, on the basis of some observable surface features, a Chinese, German, or female “essence” which causally determines a set of negative features. The attribution is “licensed” because members of the neutral counterpart group, in the eyes of the racist or homophobe, just are the paradigmatic instantiators of features that indicate the presence of the relevant essence. In most cases, already instantiating surface features such as +LOOKING FEMALE or +BEING GERMAN will have sufficient inductive power as to license the inference to the relevant essence for the slur user. This accounts for the meaning profile we attribute to (10)–(12). The slurs then generally apply to the targets that belong to the social group we call ‘neutral counterpart’, because, in the eyes of the slur user, the mentioned surface features generally license application. The uses are derogatory: Making members of the social group in question subject to this causal-deterministic essentialization conveys to them that they don’t deserve the full respect we grant persons qua persons.

(4) Non-derogatory, Non-appropriated Uses of Slurs
Another species of slur that is often considered problematic in the literature are non-derogatory examples of slur uses, sometimes termed “non-weapon” (Jeshion, 2013a) or “NDNA” uses (where “NDNA” stands for “non-derogatory, non-appropriated”; see Hom, 2008). One example of an NDNA use is (from Hom, 2008):
(13) "Institutions that treat Chinese as chinks are morally depraved."

Accounts that treat slurs as truth-conditionally equivalent to their neutral counterpart terms predict that (13) is true exactly when (14) is:

(14) "Institutions that treat Chinese as Chinese are morally depraved."

But intuitively, many speakers would assign truth to (13) while rejecting (14). In addition, many expressivist accounts predict that (13) is derogatory, since each assertion of a proposition containing a slur is an expression of contempt. However, according to some theorists—prominently, Chris Hom—(13) is an instance of a non-derogatory (even if upsetting, triggering, and hence offensive) speech-act.\(^2\)

By now, it should be clear how my account explains the fact that (13) is felicitous and at least different in derogatory status from the examples we encountered earlier. ‘Chinese’ and ‘chink’ are not synonymous according to my account; only the latter term is true of those individuals that share a “Chinese essence” which causes them to exhibit negative stereotypical features. The speaker of (13) thus expresses that institutions that treat the group of Chinese people in this causally deterministic manner are morally depraved—which is evidently true and thus accords with our truth-intuitions.\(^3\)

3. Like others, I have the intuition that even uses in intensional contexts like (13) will be upsetting or offensive, e.g., as a result of triggering effects. However, we might still want to agree with Hom that there is some principled difference in degree of derogation (as opposed to offensiveness) between non-NDNA uses and NDNA uses, and expect a theory to capture this difference. Alternatively, the slur might trigger an existential presupposition such that derogation projects out even in this intensional context, in which case the phenomenon would fall under my later discussion of derogatory projection.

32. A reviewer pointed out to me that NDNA uses of this kind could be analyzed metalinguistically. Although I understand—in fact, as will become clear in the next sections, advocate—this point when applied to some cases of negation (as has been done, for example, in Anderson & Lepore, 2013; Bolinger, 2017; Jeshion, 2013a; and particularly rigorously in Cepollaro, 2017), it is hard for me to see how a metalinguistic move can be applied to (13). Especially in light of the fact that (a) no slur is mentioned before the occurrence of the slur that (b) no reading in which a comment on a linguistic item is made is available to me, since (c) as clearly introduces an intensional context, it is unclear to me how a metalinguistic analysis for this case should work. But since the main focus in this part of the paper is to motivate the essentialist theory by showing that it covers a wide range of data, and not so much on refuting alternative theories, I will leave this issue aside for now.
group membership in non-accidental ways to negative properties that emerge from the oppression. Since the oppressive forces converge on individuals because they are taken to be members of the group, the connection is causal. Since membership in the socially constructed kind is in part a question of whether one is taken to be or treated as a member of that kind, the causal connection is through group membership. If that is the case, the conditions specified by a slur might sometimes be satisfied and the slur can successfully refer. This is an important objection to the null-extension hypothesis. In response, I want to highlight certain assumptions that constrain our representations of “essences”: We see them as internal and intrinsic to the subject; a class of subjects cannot possess an essence relationally. As Haslanger (2011) puts it for the case of generics:

[Generics license the inference that] the fact in question obtains by virtue of something specifically about the subject so described, i.e., about women, or blacks, or sagging pants. In the examples I’ve offered, however, this implication is unwarranted. The facts in question obtain by virtue of broad system of social relations within which the subjects are situated, and are not grounded in intrinsic or dispositional features of the subjects themselves. (my emphasis, Haslanger, 2011, p. 446)

Similarly, the causal element of slurs presupposes that the essence is intrinsic, not extrinsic, to the subject. Since this condition is not satisfied in the cases I’m discussing, slurs don’t have extension.

In contrast to my account, many other accounts, such as Anderson and Lepore’s minimalist and Jeshion’s expressivist accounts, are committed to the view that the sentences in (15)–(17) are true. But also accounts that lie closer to the account I propose here differ in the predictions they make about slurs’ reference and, correspondingly, the truth of sentences containing slurs. Consider Croom’s family resemblance view of slurs (Croom, 2011; 2015). According to him, slurs encode a set of negatively-valenced weighted features. If a person P satisfies sufficiently many features of the feature list associated with a slur S, S is true of P. However, it is not implausible that there will be individuals that happen to exhibit the features associated with the slur — as a matter of structural injustices, or simply because of their very individual life choices. Thus, the extension of slurs will not be the empty set under Croom’s account. Specifically, a sentence such as

(18) “Alberto is a spic.”

would have to be treated as strictly true if Alberto happens to satisfy a number of features associated with the slur, which, according to Croom, include features such as “x is a Mexican-American” or “x is a foreign worker or exchange student with a thick non-native accent” (Croom, 2014b, p. 162). The essentialist account differs from Croom’s insofar as what is decisive for the successful reference of the slur is whether the target possesses some intrinsic “Latino essence”, which slur users take to unify all ‘spics’, that disposes them to exhibit negative traits. Thus, (18) will be false even if Alberto happens to exhibit a number of features corresponding with the stereotype. Again, while these accounts might be able to appeal to explanations that lie outside the domain of their theories to explain our falsehood and referential intuitions about slurs away,34 the essentialist theory accounts for them directly.

The null-extension consequence of my view also gives us the resources to deal with a species of NDNA uses of slurs that can be classified as “metalinguistic denial”:

(19) “There are no chinks at my university, there are only Chinese people.”

Take this sentence to be uttered by a non-racist who, upon hearing (12), intends to express that the slur does not apply to Chinese people at the university, while ‘Chinese’ does. The question is how a non-racist person could a) negate the slur predicate while applying the ‘Chinese’

34. For such a strategy, see, e.g., Anderson and Lepore (2013); Camp (2018); Jeshion (2013b); or Whiting (2013).
predicate, and, again, b) do so without derogation. My framework predicts that (19) has these properties. The non-racist and properly informed person rejects the causal connection between a “Chineseness essence” and the negative stereotypical properties encoded in the slur. She rightly thinks that *nothing* is in the extension of ‘chink’: It is true of nobody that they have a “Chineseness” nature that causally disposables them to manifest negative stereotypical features associated with being Chinese. By asserting the first conjunct of (19), she just rejects what she correctly believes to be false. Since the speaker of (19) expresses that Chinese people don’t fall under the extension of the slur (since no one does), we can also classify (19) as an instance of metalinguistic denial.

Before moving on, I will address an objection that Sennet and Copp (2015) raise against the null-extensionality thesis as defended in Hom and May (2015). If successful, it would also apply to my version of the thesis. Fortunately, it isn’t. Their charge is that null-extensionality of slurs entails that sentences of the following kind are trivially true:

(20) “All kikes are Mormons.”

But, contra null-extensionality, Sennet and Copp remark that (20) is intuitively false.

A standard position in formal semantics is that we should introduce an existential domain condition (in other words, a *lexical existential presupposition*) to our semantics for universal quantifiers, since this would increase the descriptive accuracy of our theory of quantifiers with respect to sentences like (21)–(23), which would all come out as trivially true without such a condition.

(21) All mermaids live in Ohio.

(22) Every unicorn admires Noam Chomsky.

(23) All phlogiston is located in the Pacific Ocean.

If you agree with the position that quantifiers come with lexical existential presuppositions, then (20) will come out as false or truth-valueless. If you don’t agree with it, (20) will come out as trivially true, but so will (21)–(23) — which doesn’t lead anyone to worry about whether ‘mermaid’, ‘unicorn’, or ‘phlogiston’ in fact have an extension. In short, the objection doesn’t pose any problem for null-extensionality views of slurs.

(6) Derogatory Projection

Importantly, although slurs have null-extension, uses of slurs still carry an *existential presupposition*. Slur users presuppose that *there are* individuals that fall under the extension of the slurs they use. This accounts for a peculiar, well-known fact about slurs’ projection behavior: Their derogatory effect persists in various compositional contexts, such as negations, conditionals, modals, or questions (Anderson & Lepore, 2013; Bolinger, 2017; Camp, 2013; 2018; Cepollaro & Stojanovic, 2016; Hom, 2010; Jeshion, 2013b).

(24) “He’s not a kike, he’s a Muslim.”

(25) “How many chinks are at the University of Southern California?”

(26) “If he’s a wop, I won’t date him.”

(27) “She’s so bad with the wand, she might be a mudblood.”

37. The existential presupposition is (arguably) not triggered in instances of metalinguistic denial, as in (19) or in cases of negative existentials in contexts of the type: “He isn’t a chink; no one is.”

Note that there is no controversy about whether sentences like (21)–(23) introduce some existential presupposition. The question is whether it is to be located lexically or pragmatically.
Take, as an example, (24). Although the speaker does not attribute a “Jewish essence” to the object of discourse, (24) clearly stays an instance of derogatory slur usage. Why?

Usually, when we introduce entities into a discourse by talking about them, we signal to our interlocutors that we take their existence for granted:

(28) Do you prefer cats or dogs?
(29) This isn’t silver, it’s stainless steel.
(30) If that’s lemonade, I want it.
(31) The woman we met yesterday was so eloquent, she might be an English professor.

Uttering (28)–(31) presupposes that you believe there are cats, silver, lemonade, or English professors. Analogously, utterance of any sentence in (24)–(27) is only felicitous if the speaker presupposes that there are objects in our domain the slurs apply to. But presupposing, like the speaker does in (24), that there is something like a “Jewish essence”, carried predominantly by Jewish people that causally predisposes them to exhibit negative features, of course dehumanizes and derogates the entire group of Jews. This explains why the derogatoriness of slurs persists even if the speaker does not assertively predicate a causally potent essence to a discourse object. And since in reality, nothing is in the extension of slurs, the informed speaker is licensed to respond with a denial of the presupposed content.39

(7) Derogatory Variation
Let us now turn to the last explanandum on our list. It is widely thought that some pejoratives are more powerful in their disparaging and derogating force than others, a phenomenon that is standardly listed as a central explanatory desideratum for theories of slurs (Anderson & Lepore, 2013; Bolinger, 2017; Hom, 2008; 2010). Compare, for example, the difference in offensiveness between the N-word and ‘limey’—the former is substantially stronger in its derogatory effects than the latter. The same goes for ‘chink’ vs. ‘kraut’, ‘kike’ vs. ‘honky’, ‘wog’ vs. ‘yank’, and so on.40 Furthermore, the derogatory content of a slur can vary as a function of time: The derogatory force of ‘kraut’ or ‘commie’, for instance, was substantially stronger during the time of World War II and the Cold War, respectively, than it is now.

Many theories contend that the difference in encoded negative attitudes or negative descriptive information is what accounts for the fact that slurs differ in their derogatory strength.41 Prima facie, this explanation seems very plausible. For example, we often find that powerful slurs are also associated with very negative stereotypes. Most would agree that the social stereotypes associated with white people (‘honky’) are less negatively valenced than the stereotypes associated with people of Chinese ethnicity (‘chink’), which in turn are less negative than the ones associated with black persons (N-word).42 And knowing

38. Note that we can successfully apply the well-known “wait a minute” test to (24)–(27), revealing the existential presuppositions triggered by the examples. This test is standardly employed to test the presuppositions triggered by a sentence (von Fintel, 2009). Consider,

(32) Stephen stopped smoking.

The “wait a minute” test reveals that (32) presupposes that Stephen smoked. If I am not willing to accommodate the common ground appropriately—because I think that Stephen never smoked—I can felicitously respond: “Wait a minute—Stephen never smoked!” Similarly, “Wait a minute—there are no kikes!” conveys the refusal to accommodate the common ground as required by the existential presupposition.

39. Correspondingly, our earlier example (19) would be an appropriate answer to the question asked in (25), as it expresses refusal to accept the existential presupposition that the speaker introduces by its utterance.

40. See Mullen and Leader (2005) and Rice et al. (2010) for an empirical quantification of these differences.

41. That holds true especially of views that are close to the view I advocate here (e.g., Croom, 2011; Hom, 2008), but is also a move open to expressivist views.

42. For an empirical quantification of the negative stereotypes associated with some of the social groups referenced in this paper, see, e.g., Bessenoff & Sherman (2000); Copping et al. (2013); Cvencek, Meltzoff, and Greenwald
that others think ill of or harbor negative attitudes against us hurts. This is true even when the agents that harbor these attitudes are not significant to us. Imagine you notice how a bunch of teenagers in the subway are snickering, making it obvious that you are the source of their amusement. These teenagers are complete strangers, and you will never see them again. You know that whether these teenagers think well of you or not has no impact whatsoever on anything you take to matter in your life. Still, their snicker hurts.\textsuperscript{43} Naturally, then, stronger negative attitudes will hurt more, and weaker negative attitudes will hurt less.

However, this explanation can’t be the entire story. It misses out on a general, systematic pattern of how the derogatory force of different slurs varies. Why is it that in general, slurs that target someone on the basis of their race, ethnicity, gender, or sexuality are particularly toxic?\textsuperscript{44} It is hard to imagine a slur targeting fans of, say, an opposing football team to possibly be more derogatory than slurs such as ‘faggot’ or ‘kike’ — even if the properties associated with these fans were highly negative. By the same token, these slurs seem to be more diminishing than ‘lardass,’ ‘libtard,’ or ‘junkie,’ although the corresponding groups are, from the perspective of the users, associated with highly negative stereotypes. Theories that solely rely on differences in negative attitudes or descriptive information can’t account for this fine-grained pattern of the data.

The essentialist theory captures this subtle pattern. The slurs we find particularly toxic — the ones targeting someone on the basis of their race, sexuality, gender, or ethnicity — are the ones which, in addition to encoding profoundly negative stereotypes, are highly essentialized. In each case, the slur expresses that it is in someone’s very nature to have features that are bad. And while knowing that you think badly of me hurts, knowing that you think badly of me because of something in my intrinsic, inescapable nature is deep. What I do and who I am is not seen as a matter of my individual choices and agency, but as a deep matter of my nature. This is what it means to dehumanize.

Let us go in more detail through my semantic model and the way it explains the data. I maintain that the derogatory force of a slur is a direct offspring of its semantics, where the essence and the set of negative features are the determining factors of a slur’s meaning. The derogatory strength of a slur therefore is a function of these elements. The more negative the represented stereotype of a group is, the more demeaning the corresponding slur should come out.\textsuperscript{45} The more a category is essentialized, the stronger the diminishing effects of the slur should be. When the two of them come together, the derogatory force of slurs is explosive.\textsuperscript{46} Thus, holding the level of essentialism (largely) fixed, slurs for groups with stronger negative stereotypes are more derogatory. Holding the degree of negative stereotyping fixed, slurs for groups which are more essentialized will be more derogatory.\textsuperscript{47} When

\begin{itemize}
  \item \textsuperscript{43} Of course, the represented stereotype must also conventionally govern the slur in question. However, we can say that our representation of the stereotype of the social group most associated with the slur is a rough measure of the stereotype convention that governs the slur.
  \item \textsuperscript{44} Interestingly, high level of essentialism towards a social group has often been found to predict negative stereotyping and prejudice (see Bastian & Haslam, 2006; Haslam & Ernst, 2002; Haslam & Levy, 2006; Howell, Weikum, & Dyck, 2011; Levy & Dweck, 1999; Pauker et al., 2010; Prentice & Miller, 2007; Williams & Eberhardt, 2008). See also Leslie (2017) for a discussion of our tendency to attribute features to an essence of a basic-level category when these features are negative.
  \item \textsuperscript{45} These comparisons are not completely clean — it proves hard to keep the essentialist or stereotype dimensions fixed when making comparisons. It is very plausible, for example, that the social category of communists was more essentialized during the Cold War than it is now. Similarly, although “race” receives generally the highest essentialism ratings, essentialism for
\end{itemize}

\textsuperscript{44} The example is based on an example used in Bero (2017).

\textsuperscript{43} In a similar vein, Popa-Wyatt asks in her 2016 paper: “Is it coincidence that many of the most offensive slur words are associated with groups we might identify as oppressed?” (Popa-Wyatt, 2016, p. 155). My answer to that question is “No”: group essentialism is the key variable explaining both group oppression and the derogatory potential encoded in slurs (see Appiah, 2018; Leslie, 2017; Livingstone Smith, 2011).
a category is both strongly essentialized and the associated stereotypes are highly negative, the diminishing force of a slur culminates.

While it is evident that the negative stereotypes we associate with a group can be more or less pronounced, it has also long been established that there are differences in the degrees to which we essentialize social groups. In an important study, Nick Haslam and his colleagues (2000) developed a set of questions that assessed different dimensions along which we essentialize groups. Specifically, they tested whether participants essentialized social groups along the dimensions of naturalness, stability, discreteness of category boundaries, immutability of category membership, and necessity of category features.\(^{48}\) Within the 40 social categories that were rated,\(^{49}\) the categories of gender, ethnicity, and race as well as Jesus and homosexuals received particularly high ratings, and the categories associated with interests, politics, appearance, and social class received the lowest ratings.\(^{50}\)

And if we bring to our minds the slurs that are the derogatorily deepest, we will directly see that they fall under one of those social categories. Note also that the essentialist theory gives us a natural way to accommodate the theoretical difficulty of finding a clear demarcating criterion distinguishing slurs from non-slurs. Many theorists draw a distinction between slurs, which target individuals based on their membership in a group, and individual pejoratives, which target individuals based on some (temporary) behavior or “personal qualities”. While everyone can point at paradigmatic examples of slurs, and paradigmatic cases of individual pejoratives (‘jerk’, ‘ashole’, ‘dickhead’), and most feel the intuitive pull to theoretically distinguish between these two classes (although see Jeshion, 2013a for a criticism of this distinction), there are many pejorative terms that have proven to be quite difficult to classify in one way or the other. Consider,

\begin{enumerate}
\item[(33)] “Hey fatsio!”
\end{enumerate}

Popa-Wyatt (2016) notices that (33) – like ‘lardass’, ‘druggie’, ‘junkie’, ‘bum’, or ‘commie’— sits in the middle ground between [slurs] and [individual pejoratives] [...]. Like pejoratives targeted at individuals, they identify the targeted individual on the basis of specific properties that s/he has. But like slurs, they express contempt not only about the particular individual but also about other people who have similar features, and so may be identified as part of a group. (p. 152)

Essentialism about slurs explains why it is difficult to find a clear line distinguishing slurs from individual pejoratives. Just as essentialism ratings are on a continuum, our judgements about whether something is a slur or not will be on a continuum, rather than an all-or-nothing affair. People are less sure about whether people with higher body weight or communist attitudes are describable by having some “group prejudice and negative stereotyping towards groups such as homosexuals (Haslam & Levy, 2006).
essence” that determines their behavior, traits, and unifies them, or whether they should be characterized simply as having mutable, individual properties. Hence, in these cases, subjects will be reluctant, unsure, or in disagreement about whether to call a term ‘slur’ or an ‘individual pejorative’, just as predicted by the essentialist theory.

In sum, theories that appeal to differences between descriptive or expressive attitudes towards different social groups only can account for derogatory variation if we carve up the data in a very coarse-grained, one-dimensional way. To account for the subtle pattern we find in the data, we need another parameter. The essentialist theory delivers this level by adding another dimension to the derogatory potential of a slur: The derogatory force of a slur is a function not only of the negative stereotypes it encodes, but its stereotypes and the degree to which it essentializes. The essentialist theory, then, uniquely captures the systematic pattern we find in the data and explains why slurs that are particularly deep in their offensiveness tend to fall under specific categories; categories that are strongly essentialized.

§3 Slurs and the Psychology of Social Kinds

3.1 Experimental Evidence for the Essentialist Theory

Thus far, I have motivated my theory by showing that an essentialist semantics for slurs can account for their main linguistic properties. I now present converging evidence from cognitive psychology for the existence of the cognitive structures postulated by my theory of slurs. As I indicated earlier, I here assume an intimate link between linguistic meaning and mental concepts. More specifically, according to the background view I take for granted in this paper, terms inherit their linguistic meaning directly from internally individuated lexical concepts, which I understand as the smallest constituents of thought and primary bearers of meaning. From this perspective, studying the structure and information encoded in lexical concepts can directly inform our semantic theory. We will review evidence in favor of the two central components of my essentialist analysis: (1) Slurs are semantically structured in an essentialist way, and (2) slurs are uniquely associated with negative stereotypes.

Let us start with component (1). Through a number of well-established psychological paradigms, cognitive psychologists have documented that certain categories—especially natural kind categories such as animals, minerals, and chemicals—are cognitively represented in a highly essentialized way. We act as if members of certain categories have immutable, enduring, and natural essences which make them what they are (for an overview, see Gelman, 2003; 2004). Furthermore, as we have already seen in the last section, we now know that we also think of many human or social categories in this exact same, highly essentialized, way.51 More concretely, we behave as if social groups are real kinds: They have sharp category boundaries, are somewhat “natural”, historically stable, “real” and not constructed, and allow for rich inductive inferences about physical and behavioral traits of their members.52 In particular, social categories such as race and ethnicity (Allport, 1954; Gil-White, 2001; Haslam et al., 2000; Hirschfeld, 1996; Ho, Roberts, & Gelman, 2015; Pauker et al., 2016; Verkuyten, 2003), gender (Gelman, 2003; Gelman, Collman, & Maccoby, 1986; Prentice 2001; Haslam et al., 2000; Hirschfeld, 1996; Prentice & Miller, 2007). For a general overview of the evidence tracking children's essentialist belief structure, see Gelman (2003).

51. There is wide-ranging evidence that we hold essentialist beliefs from early childhood on, which has been documented by psychologists—prominently, Susan A. Gelman—throughout the past 30 years. For example, preschool children believe that a baby kangaroo raised among goats will grow up to hop and have a pouch (Gelman & Wellman, 1991; cf. Gelman, 2003). They also expect that something that has turtle insides will still be a turtle even if it doesn’t look like one (Gelman & Wellman, 1991), suggesting that they don’t rely on observable surface features to determine kind membership. For our tendency to essentialize social categories, see, e.g., Gelman (2003); Gil-White (2001); Haslam (2000) Haslam & Levy (2006); Haslam et al. (2000); Hirschfeld (1995; 1996); Prentice & Miller (2007). For a general overview of the evidence tracking children’s essentialist belief structure, see Gelman (2003).

52. See, e.g., Demoulin, Leyens, & Yzerbyt (2006); Gelman (2003); Haslam et al. (2000). It is important to keep in mind that these markers are characteristic features of our representation of essences, and do not constitute necessary conditions for something to be represented as an essence. This conception of essences also doesn’t completely correspond to the philosopher’s as “that intrinsic aspect of a thing that grounds all and only the intrinsic metaphysical necessities that hold of the thing” (Leslie, 2017, p. 406).
& Miller, 2006; 2007), caste (Mahalingam, 2003), sexual orientation (Haslam & Levy, 2006), religion (Chalik, Leslie, & Rhodes, 2017; Tossi & Ambady, 2011), and mental illness (Haslam, 2000; Haslam & Ernst, 2002; Howell, Weikum, & Dyck, 2011) — in short, the categories that are central to human slurring practices — have been found to be cognitively represented in a highly essentialized way.\(^\text{53}\)

For illustration, consider the case of race: This category is certainly among the most relevant for slurs, given both the prevalence and deep offensiveness of epithets that target subjects on the basis of their race. In a series of pivotal experiments, psychologist Lawrence Hirschfeld documented essentialist thinking about race in both adults and preschoolers as young as three years (Hirschfeld, 1995; 1996; see also Pauker et al., 2010). In one paradigm, he asked preschoolers whether a racial property class — hair and skin color — or a physical property class — clothing style and color — would remain unchanged as a person grows up. Even 3-year-olds judged that the properties connected with race were more constant than sartorial properties.\(^\text{54}\) He obtained the same preference for race as the dominant factor compared to other physical features for inheritance judgements: When children were asked which properties they would inherit from their parents, they predominantly picked racial properties. In a switched-at-birth paradigm, children were asked which racial properties a child that was adopted by parents of another skin color would develop. 5-year-olds outweighingly decided in favor of the birth parents’ racial properties (Hirschfeld, 1996).

To sum up, reasoning about social categories follows typical essentialist dimensions already in early childhood. Thus, my proposed structure of slurs neatly corresponds to the essentialist structure of social categories that has been systematically uncovered by cognitive 53. See also Prentice and Miller (2007) for an overview.

psychologists for the past 30 years. If we take these findings at face value, we must, in any case, accept that many social concepts have an essentialist structure. Accordingly, to assume that also slur terms are associated with essentialistically structured concepts is not only descriptively plausible but also theoretically parsimonious.

Let us now turn to the second key component of my semantics, namely, that slurs encode negatively valenced stereotypes. Recently, the phenomenon of slurring language has begun to be empirically investigated by psycholinguists. These studies revealed that slurs, in contrast to their neutral counterpart terms, are uniquely associated with negative features. Since these studies used implicit paradigms in some of their studies, we have good reasons to think that these negative features belong to the semantic representation of slurs.\(^\text{55}\)

In an experiment using a free association paradigm, Carnaghi and Maass (2008) delivered primary evidence for the negative stereotypes encoded in slurs. They presented participants with derogatory words (‘fag’) or their neutral counterparts (‘gay’). When presented with the slurs, the first three words participants mentioned were significantly more negatively-valenced than when presented with their neutral counterparts. However, since this experiment used an explicit paradigm, we cannot make strong inferences about the semantic structure of slurs on the basis of it.\(^\text{56}\) For this reason, in a follow up study, Carnaghi

55. There are many ways to carve up the semantics-pragmatics distinction. In this paper, I assume the psychology-based framework according to which semantics includes those representations that enter into and are the result of immediate composition by our linguistic competence, and pragmatics includes all post-compositional representations that have been subject to general reasoning processing from central cognition.

56. The most important limitation of explicit tasks is that they do not impose any constraints controlling for response modifications by conscious reasoning and voluntary control. For example, the negative association could as well be a post-semantic, pragmatic-inferential phenomenon and would thus not constitute evidence in favor of the hypothesis that stereotypes are semantically encoded in slurs. To reveal the “bare” linguistic representations behind slurring words, it is more appropriate to employ a paradigm whose task outcomes are not influenced or distorted by other non-semantic cognitive operations. Implicit tasks are ideal to unveil the semantic representations behind slurring words, since their task outcomes are less prone to be a result...
and Maass used a semantic priming task. They presented participants subliminally with a prime word that was either a neutral term (‘gay’), a derogatory counterpart term (‘fag’), or a nonsense term (‘secadftg’). Hence, the participants never consciously noticed with which word they were primed. This is important, as it eliminates the risk of task interventions by conscious higher-level pragmatic processes. Following the prime, the participants were to engage in a lexical decision task. They saw a target word that was either a trait stereotypical of the prime word (e.g., ‘elegant’ or ‘effeminate’), counterstereotypical (e.g., ‘energetic’ or ‘intolerant’), or completely unrelated (‘honest’ or ‘stingy’). Importantly, half of the traits were positively valenced, while the other half of the target words was negatively valenced. The participants’ task was to make a lexical word/nonword decision as fast as possible. The study had two key results. First, the participants reacted significantly faster to stereotypical targets than to counterstereotypical or unrelated targets, regardless of whether the prime was neutral or derogatory. This means that both neutral and derogatory category representations immediately and automatically activate representations of the related stereotype features. Second, the authors found that derogatory labels were again significantly less likely to activate flattering associations of the social group. As a matter of fact, derogatory labels resulted in the suppression of any positively-valenced stereotype, giving way for the negatively valenced associations related to a group.  

In sum, these experiments show that a) slur terms encode the stereotype associated with a social group, and that b) this stereotype differs in valence from the stereotype encoded in the neutral counterpart, of intermixed high and low-level processes. This requirement was satisfied in Carnaghi and Maass’ follow up study.  

57. In a later study (Carnaghi & Maass, 2007), the authors successfully replicated the results, speaking to the robustness of their findings.  

58. Needless to say, this research, together with the abundant amount of research on typicality effects originating in Eleanor Rosch’s research program (Rosch, 1988), supports that typicality effects are robust and thus relatively stable among subjects. Even critics of prototype theory often describe this stability as the most attractive feature of prototype theory (Fodor, 1998).  

which confirms, experimentally, that there is a major semantic difference between neutral category labels and their corresponding epithets. In similar vein, the authors of the studies conclude that  

[t]ogether, these results suggest that derogatory group labels differ from category group labels mainly with respect to the valence of the associations they elicit. Thus, it is not so much the ability to activate stereotypical content that distinguishes derogatory from category group labels. (Carnaghi & Maass, 2007, p. 147)  

We saw in the last section that my view explains the central linguistic data involving slurs, and I have now shown that it receives additional, converging evidence from cognitive psychology. Specifically, we have seen that social concepts associated with social terms are organized essentially, and that slurs are uniquely associated with negatively valenced stereotypes. As a result, my semantic theory converges with an independently plausible research program on the view that social concepts have essentialist structure, and is directly supported by experimental research on slurring words.  

3.2 Nomen est Omen: The Important Role of Nouns  

If you go through a mental list of the slurs that you are familiar with, you will probably notice that all of them belong to the syntactic category of nouns. This is peculiar, given that most of slurs’ neutral counterparts come in both nominal and adjectival form (e.g., ‘a homosexual’/’homosexual’; ‘a Jew’/’Jewish’; notice also prepositional constructions such as ‘someone with homosexual preferences’, ‘someone from Mexico’, etc.). A complete linguistic theory of slurs should be able to explain this systematic pattern, and not treat it as a mere accident. Interestingly, this syntactic inflexibility of slurs is, too, directly predicted by the essentialist theory. That is, in contrast to other available theories, the essentialist theory is not only compatible with, but...
makes sense of the fact that nouns are the primary linguistic vehicle through which we communicate the semantic information of slurs.

There are a variety of different linguistic devices by means of which we can assign an individual to a category. Borrowing an example from Wierzbicka (1986), consider the difference between the sentences “Anna is blond” and “Anna is a blonde”. In both cases, we predicate a property (blondness) to Anna, and thereby include her in the set of things that instantiate blondness. But although the set-theoretic operations of both predicates are prima facie identical, a closer look reveals that there are big disparities in the information conveyed by the adjective and the noun. Whereas the former predicate ‘blond’ simply refers to a quality — a specific hair color — the latter predicate, ‘a blonde’, is a sortal that refers to an object, or, rather, a person that can have a whole bunch of other qualities. Normally, we even feel compelled to make a number of inferences about which these other qualities are that Anna, being a blonde, has. By using the noun rather than the adjective, the speaker conveys that Anna is sexy or not particularly bright.

Another example, adopted from Gelman (2003), is a case in point. The Atlanta baseball player John Rocker was criticized for making a racist comment in an interview. When an ABC News reporter asked him directly, ‘Are you a racist?’ he answered: ‘Absolutely not. […] You hit one home run in the big leagues, it doesn’t make you a home run hitter. […] To make one [racist] comment like this doesn’t make you a racist.’ Although Rocker’s argument structure seems disputable (to say the least), it does tell us something about the underlying conceptual difference connected to a noun (‘a homerun hitter’, ‘a racist’) and a verb phrase (‘to hit a home run’, ‘to make a racist comment’). Importantly, Rocker himself seems to take for granted that the verbal choice he makes directly conveys the difference in meaning between ‘to hit a home run’ and to be ‘a homerun hitter’. Whereas the first choice of syntactic category conveys a temporary state that does not originate in any identifying property of the person, the latter noun form implicates an enduring, stable state that is central to the person’s identity and reliably causes a number of other properties of the person (Gelman, 2003, p. 188). In short, nouns intuitively (‘a racist’, ‘a schizophrenic’, ‘a blonde’, ‘a liar’, ‘a homerun hitter’, etc.) impart a form of essentialism: The property that is nominalized is vital to the person’s identity and allows for a variety of inductions. Other grammatical forms, such as adjectives and verb constructions (‘have schizophrenia’/‘schizophrenic’, ‘to have blond hair’/‘to be blond’, etc.) rather convey mutable, temporal qualities of an individual.

That nouns are much stronger in their essentialist-communicative potential than other word forms has received much empirical support. In one study, Susan Gelman and Gail Heyman compared the inductive potential children infer from noun and verb labels (Gelman & Heyman, 1999). They either heard a story that contained “a carrot eater” (noun phrase; NP), or a story that talked about someone who “eats carrots whenever she can” (verb phrase; VP). In the critical part, the children answered a set of questions that tested the stability of the properties: e.g., “Will Rose eat a lot of carrots when she is grown up?” or “Would Rose eat a lot of carrots if she grew up in a family where no one liked carrots?” Children in the NP condition predicted significantly more often that the property in question would be more stable over time and in adverse environmental conditions than children in the VP condition. Thus, the grammatical form of a noun seems to suggest to a child that a category is to be thought of as a kind (Gelman & Heyman, 1999).

Carnaghi et al. (2008) replicated and developed the experiments initiated by Gelman and Heyman. In multiple experiments testing adults, they compared the inductive potential of nouns and adjectives which assign individuals to the same categories (e.g., ‘an athlete’ vs. ‘athletic’). They found that describing a person by a noun triggers significantly more stereotypical inferences as compared to an adjectival description. Remarkably, nouns also inhibit inferences about behaviors or habits that are associatively rather incongruent with the descriptors. For example, a person that is homosexual (adjective) was estimated to attend the church more often than a homosexual (noun). Moreover, nouns but not adjectives inhibit the possibility of
alternative classifications altogether (i.e., not only incongruent ones). Once someone is categorized as belonging to one social category, e.g., ‘artist’, participants are not very willing to assign them to a second one, e.g., ‘athlete’. These results did not hold for adjectival conditions, because nouns as opposed to adjectives tend to convey discrete category boundaries which do not intersect with other categories. Finally, when Carnaghi et al. primed subjects with an essentialist scenario, participants would even themselves be more likely to use a noun to describe a person.

In sum, nouns, adjectives, and verb phrases do not only categorize individuals, but also tell us something about the particular way in which the individuals are categorized. In the case of adjectives, the individual is assigned to one qualitative category among many potential others. In the case of nouns, the individual is assigned to one category that identifies the individual in question in a rather all-or-nothing way and allows for rich inferences with regard to qualities that (allegedly) come along with the stable category in question.

At this point, it should be clear why my essentialist theory explains that nouns are the main syntactic vehicle of slurs. According to my theory, slurs encode essentialist information. We have now seen that nouns are the primary linguistic device we use to convey that a category is essentialized. So if the semantics of slurs is essentialist, nouns should be the primary linguistic vehicles for communicating the meaning of slurs. Thus, the essentialist account uniquely predicts and explains this striking syntactic pattern of slurs.

**Conclusion**

In the closing scene of *I Am Not Your Negro*, James Baldwin offers a powerful, penetrating diagnosis of White America:

> What white people have to do, is try to find out in their hearts why it was necessary for them to have a nigger in the first place. Because I am not a nigger. I’m a man. If I’m not the nigger here, and if you invented him, you the white people invented him, then you have to find out why. And the future of the country depends on that. Whether or not it is able to ask that question. (Baldwin, 1963)

This paper was an attempt to contribute to the task assigned so poignantly by Baldwin, and come a step closer to an answer to his question. I have argued that the central mechanism of slurs is one of essentialization; slurs are akin to kind terms that denote an essence of a social category which nomologically connects to a set of negative stereotypical features. In effect, by using slurs, or even having them in our public lexicon, we commit to a way of carving up the social world that is dehumanizing and gives groups with the dominant share of social power a tool to rationalize and maintain the oppressive hierarchies that keep down marginalized groups.

To illustrate the plausibility of the essentialist theory, and show that it does interesting, multi-layered explanatory work, I argued that, first, essentialism about slurs explains their recognized linguistic properties; second, that the essentialist theory receives convergent evidence from cognitive psychology; and third, that the essentialist theory has unique resources to explain why slurs occur predominantly as nouns. Importantly, the goal of this paper has been to make a cumulative case for the essentialist theory and motivate it as a novel, interesting framework that takes seriously the challenge of linking prejudiced, hateful, or bigoted language to cognition and explains its relation to social oppression. Although one might disagree with the assessment of some of the data, it is important to note that my view does not stand or fall on the basis of a single piece of evidence. Good theories should predict and account for a wide range of data. This paper shows that the essentialist theory does precisely that.

59. Raoul Peck’s documentary film *I Am Not Your Negro* is a collage based on the unfinished manuscripts of *Remember this House*, immersed with interview excerpts by Baldwin and a variety of other material (Peck, 2016). The final scene of the quote is based on a 1963 interview of Baldwin with Kenneth Clar. Note that the invention of the ‘nigger’ by the white world is a re-occurring theme employed by Baldwin (see, e.g., Baldwin, 1963; 1969).
