Abstract
A ruthenium-mediated sequential approach to anti-1,3-diols is described. A series of enantiomerically enriched 1,3-diols has been synthesized from β-keto esters using ruthenium-mediated asymmetric hydrogenation followed by diastereoselective hydrogenation of the resulting β-hydroxy ketones, obtained via the corresponding Weinreb amides. Using this sequence, diversely substituted anti-1,3-diols were obtained in good yields with a very high level of enantio- and diastereoselectivity (ee and de up to 99%).

Keywords: 1,3-Diols, asymmetric hydrogenation, ruthenium catalysts, atropisomeric ligands

Introduction

Because of the prevalence of 1,3-dioxygenated substructures in biologically active natural products such as polyether and polynene macrolide antibiotics,1 the stereoselective synthesis2 of these moieties is of particular interest. Besides enzymatic routes3 for stereoselective preparation of the 1,3-diol motif, metal hydride reduction of 1,3-diones4 and transition metal-catalyzed hydrogenation reactions of 1,3-diketones5 and 3,5-dioxoesters6 have been reported. Recently, a general approach to syn and anti-1,3-diols using Jacobsen’s hydrolytic kinetic resolution method has been described.7 Apart from these methods, the stereoselective reduction of β-hydroxy ketones has been extensively studied, affording either syn-1,3-diols by using Et₃B/NaBH₄8 and Et₂BOMe/NaBH₄9 combinations, or anti-1,3-diols by using Me₄NBH(OAc)₃.10 However, these boron reagents are usually employed in stoichiometric or excess quantities, generating considerable amounts of waste. Therefore, a catalytic sequential route to syn or anti-1,3-diols through diastereoselective hydrogenation of β-hydroxy ketones using ruthenium complexes would be of synthetic utility. As part of our work towards the total synthesis of biologically...
relevant natural products using ruthenium-mediated asymmetric hydrogenation as a key step,\textsuperscript{11} we were interested in developing an efficient and general catalytic route to a variety of functionalized enantiomerically enriched \textit{anti}-1,3-diols 4 by using sequential hydrogenation reactions\textsuperscript{12} of \(\beta\)-keto esters 1 and of the resulting \(\beta\)-hydroxy ketones 3 as depicted in Scheme 1.

\begin{align*}
\text{H}_2 & \quad [\text{RuL}^*_n] \\
\text{R}_1\text{OEt} & \quad \text{OH} \quad \text{O} \\
\text{O} & \quad \text{OH} \quad \text{OH} \\
\text{R}_1\text{OEt} & \quad \text{OH} \quad \text{O}
\end{align*}

Scheme 1

Hence, depending on the configuration of the chiral ligand, asymmetric hydrogenation of \(\beta\)-keto esters 1 would easily deliver both enantiomers of 2, while a variety of enantiomerically enriched \(\beta\)-hydroxy ketones 3 would be prepared from 2 by addition of alkyl or aryl lithium reagents onto the corresponding Weinreb amides. Ruthenium-catalyzed diastereoselective hydrogenation of compounds 3 would then afford enantiomerically enriched \textit{syn} or \textit{anti}-1,3-diols.

**Results and Discussion**

Thus, a variety of enantiomerically pure \(\beta\)-hydroxy ketones 3 were prepared from \(\beta\)-keto esters 1 (Scheme 2, Table 1). A series of enantiomerically enriched \(\beta\)-hydroxyesters 2 was first synthesized \textit{via} asymmetric hydrogenation of \(\beta\)-keto esters 1. Hydrogenation reactions of compounds 1\textit{a}-1\textit{d} were performed under optimized conditions using either the RuCl\textsubscript{3}/(R)-MeO-BIPHEP system\textsuperscript{13} or the [Ru((R)-MeO-BIPHEP)Br\textsubscript{2}] complex\textsuperscript{14} to furnish compounds 2\textit{a}-2\textit{d} in good yields (90-99\%) and with excellent enantiomeric excesses (95-99\% ee).

<sup>a</sup>Conditions for the asymmetric hydrogenation reactions: 2a: 0.3 mol% RuCl₃/ (R)-MeO-BIPHEP, H₂ (10 bar), EtOH, 80°C, 24h; 2b: 1 mol% RuCl₃/ (R)-MeO-BIPHEP, H₂ (20 bar), EtOH, 80°C, 48h; 2c: 1 mol% RuCl₃/ (R)-MeO-BIPHEP, H₂ (30 bar), EtOH, 80°C, 48h; 2d: 0.2 mol% [Ru((R)-MeO-BIPHEP)Br₂], H₂ (10 bar), EtOH, 80°C, 48h. <sup>b</sup>Enantiomeric excesses were determined by HPLC analysis (Chiralcel OD-H column, hexane/iPrOH, λ = 215 or 254 nm). <sup>c</sup>The absolute configurations of the hydroxy esters 2a<sup>15</sup>, 2b<sup>16</sup>, 2c<sup>17</sup>, 2d<sup>18</sup> were assigned by comparison of their specific rotations with those reported in the literature.

These β-hydroxy esters 2 were then converted into various β-hydroxy ketones 3 following a two-step sequence (Scheme 2, Table 1). Reaction of 2a-2d with N,O-dimethylhydroxylamine hydrochloride (3 equiv.) and n-butyllithium (6 equiv.) afforded the corresponding Weinreb amides<sup>19</sup> and subsequent treatment with organolithium reagents (3 equiv.) delivered 3a-3g in good overall yields (60-93%). Having synthesized a series of variously substituted enantiomerically pure β-hydroxy ketones, we were now able to study the ruthenium-mediated diastereoselective hydrogenation of these compounds using either MeO-BIPHEP<sup>20</sup> or SYNPHOS®<sup>21</sup> as the chiral ligand. To our knowledge, only one example of ruthenium-mediated
A hydrogenation of a β-hydroxy ketone has been reported in the literature during studies on the hydrogenation of pentan-2,4-dione into the corresponding anti-1,3-diol.\(^5\)\(^a\) \((2R)\)-Hydroxy-4-pentanone, the intermediate isolated during the hydrogenation of pentan-2,4-dione, has been reduced with both \((R)\) and \((S)\)-BINAP-Ru complexes into respectively the corresponding anti and syn-1,3-diols. We have thus undertaken a systematic study of the diastereoselective reduction of several diversely substituted β-hydroxy ketones (Scheme 3, Table 2).

The hydrogenation reactions were first carried out with the atropisomeric diphosphine having the (R) configuration in order to synthesize the corresponding anti-1,3-diols. Thus, all reactions were performed in methanol at 50°C under 10 bar of hydrogen with 2 mol% of [Ru(P*P)Br₂] complex. In all cases the expected anti-1,3-diols were obtained quantitatively and with a high level of diastereoselectivity, ranging from 98% to 99.5% (Table 2).

It appears from these results that the nature of the R¹ and R² substituents on compounds 3 has no influence on the stereochemical outcome of the hydrogenation reaction and neither steric nor electronic effects have been observed since the anti diastereoselectivities were invariably high using either (R)-MeO-BIPHEP or (R)-SYNPHOS as a ligand.

For comparison, β-hydroxy ketones 3b and 3f have been reduced with tetramethylammonium triacetoxyborohydride, the most commonly used reagent for the diastereoselective reduction of this type of compounds. In both cases the diastereomeric excesses were high (92% de) but quite unsatisfactory compared to the diastereoselectivities obtained through ruthenium-mediated hydrogenation (98-99.5% de) which stands for an efficient method for the preparation of anti-1,3-diols.

We have then studied the hydrogenation of β-hydroxy ketone 3b using the ligand of opposite configuration, (S)-MeO-BIPHEP in order to achieve the corresponding 1,3-syn-diol (Scheme 4).

A short study of the influence of the temperature and the hydrogen pressure on the diastereoselectivity of the reaction has been carried out (Table 3). The hydrogenation was run in methanol using 2 mol% of the [Ru((S)-MeO-BIPHEP)Br₂] complex. A temperature effect has been observed since a decrease of diastereoselectivity (from 76 to 60% de) was noted when switching from 10 to 50°C (entries 1 to 3). On the other hand, the hydrogen pressure has no effect on the stereochemical outcome of the reaction since at 25°C identical diastereoselectivities (69% de) were obtained at either 5 or 60 bar (entries 4 and 5). At both higher temperature (80°C) and hydrogen pressure (60 bar), lower diastereomeric excess was obtained (46% de, entry 6).

Likewise, hydrogenation of compounds 3a, 3c, 3g with 2 mol% of [Ru((S)-MeO-BIPHEP)Br₂] at 25°C under 10 bar of hydrogen proceeded with complete conversion and the expected syn-1,3-diols were obtained with only moderate diastereoselectivities ranging from 70% to 78% (Table 4).

aWhen the (S)-SYNPHOS ligand was used instead of (S)-MeO-BIPHEP, longer reaction times were required to achieve full conversion at 25°C whereas identical syn diastereoselectivities were obtained.

In conclusion, the ruthenium-mediated hydrogenation of β-hydroxy ketones exhibits both high levels of diastereoselection and a satisfactory degree of generality for the preparation of anti-1,3-diols. This catalytic method could be regarded as an interesting alternative to the reduction of β-hydroxy ketones with tetramethylammonium triacetoxyborohydride and should be particularly useful in total synthesis. As a synthetic application of this methodology, we have recently reported a formal synthesis of (–)-isoavenaciolide, a naturally occurring secondary metabolite isolated from the fermentation broth of *Aspergillus* and *Penicillium* species, and exhibiting antifungal activity.
Experimental Section

General Procedures. All solvents were reagent grade and distilled under positive pressure of argon prior to use. Amines and CH$_2$Cl$_2$ were distilled from calcium hydride. THF and Et$_2$O were distilled from sodium-benzophenone. Unless special mention, all reactions were carried out under an argon atmosphere. All commercially available reagents were used without further purification unless otherwise indicated. Nuclear magnetic resonance: $^1$H- and $^{13}$C-NMR spectra were recorded either at 200 MHz and 50 MHz respectively on an AC200 Bruker spectrometer, or at 300 MHz and 75 MHz respectively on an Avance 300 Bruker spectrometer. Infrared spectra (IR) were recorded on either a Perkin-Elmer 783G spectrometer or an IRFT Nicolet 205 spectrometer. Mass spectra (MS) were measured on a Nermag R10-10C mass spectrometer (DCI/NH$_3$) and on a PE Sciex API 3000 mass spectrometer (ESI). Flash column chromatography was performed on Merck silica gel (0.040-0.063 mesh). Thin layer chromatography (TLC) analysis was performed on Merck silica gel 60 PF 254 and revealed with either a ultra-violet lamp ($\lambda$= 254 nm) or a potassium permanganate solution. Melting points (m.p.) were determined on a Kofler melting point apparatus and are uncorrected. Optical rotation values were recorded on a Perkin-Elmer 241 polarimeter at 589 nm (sodium lamp). High Performance Liquid Chromatography analyses (HPLC) were performed on a Waters instrument (Waters 486 detector, 717 autosampler equipped with Daicel Chiralcel OA, OB, OD, OD-H, OJ and Chiralpack AD and AS-H).

Typical procedure for the catalytic hydrogenation of $\beta$-keto esters 1a-1d with [RuCl$_3$/$^{}$R$^{}$]-MeO-BIPHEP]

(R)-MeO-BIPHEP (0.01 equiv.) and anhydrous RuCl$_3$ (0.01 equiv., purchased from Aldrich Chemicals) were placed in a round-bottomed tube and degassed by three vacuum/argon cycles at room temperature. $\beta$-Keto ester 1 (1 to 3.3 equiv.) was added followed by degassed methanol. The reaction vessel was placed in a stainless steel autoclave, which was purged with hydrogen and pressurized under 10-30 bar. The autoclave was heated to the desired temperature by circulating thermostated water in the double wall and magnetic stirring was started as soon as the required temperature was reached. After stirring for 24-48 h, the autoclave was cooled to room temperature, hydrogen was vented and the reaction mixture was concentrated in vacuo and purified by flash chromatography. For $\beta$-keto ester 1d, the asymmetric reduction was run using the procedure described for hydrogenation of compounds 3. $\beta$-Hydroxy esters 2a-2d are known compounds, and the spectral data agreed with the literature reports.$^{15-18}$

Typical procedure for the preparation of $\beta$-hydroxy ketones 3a-3g from $\beta$-hydroxy esters 2a-2d

To a solution of N,O-dimethylhydroxylamine hydrochloride (6.69 g, 67.2 mmol) in THF (120 mL) was added nBuLi (134 mmol) at –78°C. After stirring at room temperature for 10 min, the mixture was cooled to –78°C and a solution of $\beta$-hydroxy ester 2 (22.4 mmol) in THF (35 mL)
was added. The reaction mixture was stirred at –78°C for 2h, then quenched with saturated aqueous NH₄Cl and allowed to warm to room temperature. After extraction with Et₂O, the combined organic layers were dried over MgSO₄ and concentrated. Purification of the residue by flash chromatography on silica gel (elution with cyclohexane/AcOEt: 7/3, KMnO₄). To a solution of this Weinreb amide (9.6 mmol) in THF (20 mL) at –78°C was added dropwise the corresponding alkyl lithium (28.7 mmol). After stirring at –78°C for 0.5 h, the reaction mixture was quenched with methanol and saturated aqueous NH₄Cl, then allowed to warm to room temperature and extracted with Et₂O. The combined organic layers were dried over MgSO₄ and concentrated. Purification of the residue by flash chromatography on silica gel (elution with cyclohexane/AcOEt: 8/2) afforded the pure β-hydroxy ketone 3.

(4R)-4-Hydroxyheptan-2-one (3a). 60% yield (two steps), pale yellow oil; Rf = 0.10 (cyclohexane/AcOEt 7/3, KMnO₄); 1H NMR (CDCl₃, 200 MHz): δ 0.92 (t, J = 6.6 Hz, 3H), 1.36 (m, 4H), 2.18 (s, 3H), 2.50 (dd, J = 16.4 and 8.4 Hz, 1H), 2.64 (dd, J = 16.4 and 3.5 Hz, 1H), 4.04 (m, 1H); 13C NMR (CDCl₃, 50 MHz): δ 14.0, 18.7, 30.8, 38.6, 50.1, 67.3, 210.1; MS (DCI / NH₃): m/z = 132 [M+H]⁺, 148 [M+NH₄⁺]; IR (thin film): 3426, 2960, 2925, 2873, 1701 cm⁻¹; [α]D ≈ –49.6 (c 0.23, CHCl₃).

(7R)-7-Hydroxydecan-5-one (3b). 75% yield (two steps), pale yellow oil; Rf = 0.63 (cyclohexane/AcOEt 1/1, KMnO₄); 1H NMR (CDCl₃, 200 MHz): δ 0.90 (t, J = 7.2 Hz, 3H), 0.92 (t, J = 7.2 Hz, 3H), 1.43 (m, 8H), 2.36 (t, J = 7.6 Hz, 2H), 2.52 (dd, J = 17.6 and 8.6 Hz, 1H), 2.60 (dd, J = 17.6 and 3.4 Hz, 1H), 4.03 (m, 1H); 13C NMR (CDCl₃, 50 MHz): δ 13.8, 14.0, 18.7, 22.3, 25.7, 38.7, 43.4, 49.1, 67.4, 212.5; MS (DCI / NH₃): m/z = 173 [M+H]⁺, 190 [M+NH₄⁺]; IR (thin film): 3518, 2966, 2950, 2827, 1705 cm⁻¹; [α]D ≈ –38.4 (c 1.26, CHCl₃).

(4R)-4-Hydroxytetradecan-6-one (3c). 75% yield (two steps), pale yellow oil; Rf = 0.63 (cyclohexane/AcOEt 1/1, KMnO₄); 1H NMR (CDCl₃, 200 MHz): δ 0.90 (t, J = 7.2 Hz, 3H), 0.95 (t, J = 7.2 Hz, 3H), 1.25 (br s, 10H), 1.50 (m, 4H), 2.41 (t, J = 7.4 Hz, 2H), 2.46 (dd, J = 16.4 and 8.4 Hz, 1H), 2.60 (dd, J = 16.4 and 3.7 Hz, 1H), 4.05 (m, 1H); 13C NMR (CDCl₃, 50 MHz): δ 13.9, 14.0, 18.6, 22.6, 23.6, 29.1, 29.2, 29.3, 31.8, 38.6, 43.7, 48.9, 67.3, 212.6; MS (DCI / NH₃): m/z = 229 [M+H]⁺, 246 [M+NH₄⁺]; IR (thin film): 3518, 2966, 2950, 2827, 1705 cm⁻¹; [α]D ≈ –28.7 (c 1.10, CHCl₃).

(6S)-6-Hydroxy-7-methyl-octan-4-one (3d). 69% yield (two steps), pale yellow oil; Rf = 0.22 (petroleum ether/Et₂O 7/3, KMnO₄); 1H NMR (CDCl₃, 300 MHz): δ 0.91 (d, J = 6.8 Hz, 3H), 0.92 (t, J = 7.4 Hz, 3H), 0.93 (d, J = 6.8 Hz, 3H), 1.61 (hex, J = 7.4 Hz, 2H), 1.68 (m, 1H), 2.42 (t, J = 7.4 Hz, 2H), 2.47 (dd, J = 17.3 and 9.3 Hz, 1H), 2.58 (dd, J = 17.3 and 2.8 Hz, 1H), 3.80 (ddd, J = 9.3, 2.8 and 5.9 Hz, 1H); 13C NMR (CDCl₃, 75 MHz): δ 13.6, 17.0, 17.7, 18.3, 32.9, 45.5, 45.8, 72.2, 212.7; MS (DCI / NH₃): m/z = 141 [M-H₂O+H]⁺, 159 [M+H]⁺, 176 [M+NH₄⁺]; IR (thin film): 3440, 2970, 2940, 2880, 1715 cm⁻¹; [α]D ≈ –61.7 (c 1.60, CHCl₃).

(3S)-3-Hydroxy-4-methyl-1-phenyl-pentan-1-one (3e). 62% yield (two steps), pale yellow oil; Rf = 0.55 (cyclohexane/AcOEt 6/4, KMnO₄, UV); 1H NMR (CDCl₃, 300 MHz): δ 0.99 (d, J = 6.8 Hz, 3H), 1.02 (d, J = 6.8 Hz, 3H), 1.81 (m, 1H), 3.03 (dd, J = 17.5 and 9.4 Hz, 1H), 3.18 (dd, J = 17.5 and 2.5 Hz, 1H), 4.00 (ddd, J = 9.4, 5.6 and 2.5 Hz, 1H), 7.40 (m, 2H), 7.56 (m, 1H), 7.95 (m, 2H); 13C NMR (CDCl₃, 75 MHz): δ 18.0, 18.6, 33.2, 42.1, 72.5, 128.2, 128.7, 133.5,
(1S)-1-Hydroxy-1-phenylethanol-3-one (3f). 93% yield (two steps), pale yellow oil; Rf = 0.31 (cyclohexane/AcOEt 7/3, KMnO4, UV); 1H NMR (CDCl3, 300 MHz): δ 0.90 (t, J = 7.2 Hz, 3H), 1.31 (hex, J = 7.4 Hz, 2H), 1.57 (qd, J = 7.5 Hz, 2H), 2.44 (t, J = 7.3 Hz, 2H), 2.78 (dd, J = 17.2 and 4.1 Hz, 1H), 2.86 (dd, J = 17.2 and 8.3 Hz, 1H), 5.16 (dt, J = 8.3 and 3.6 Hz, 1H), 7.25-7.40 (m, 5H); 13C NMR (CDCl3, 75 MHz): δ 13.8, 22.2, 25.6, 43.4, 51.0, 69.9, 125.6, 127.6, 128.5, 142.9, 211.6; MS (DCI / NH4O+): m/z= 189 [M-H]+, 206 [M+H]+, 224 [M+NH4]+; IR (thin film): 3430, 3070, 3040, 2970, 2940, 1730, 760, 700 cm^-1; [α]D^25 --83.0 (c 0.50, CHCl3).

Typical procedure for the catalytic hydrogenation of β-hydroxy ketones 3a-3g with [Ru((R)-MeO-BIPHEP)Br2] or [Ru((R)-SYNPHOS)Br2]

Either (R)-MeO-BIPHEP (7.0 mg, 0.012 mmol) or (R)-SYNPHOS (7.7 mg, 0.012 mmol) and (COD)Ru(2-methylallyl)_2 (3.2 mg, 0.01 mmol, commercially available from Acros) were placed in a round-bottomed tube, degassed by three vacuum/argon cycles at room temperature, and dissolved in degassed acetone (1 mL). To this suspension was added at room temperature a 0.15 N methanolic hydrobromic acid solution (147 µL, 0.022 mmol) and the mixture was stirred at 25°C for 30 min. After evaporation of the solvent under vacuum, a solution of β-hydroxy ketone 3 (0.5 mmol) in MeOH (1 mL) was added. The reaction vessel was placed in a stainless steel autoclave which was purged with hydrogen and pressurized under 10 bar. The autoclave was heated to 50°C by circulating thermostated water in the double wall and magnetic stirring was started as soon as the required temperature was reached. After stirring for 24 h, the autoclave was cooled to room temperature, hydrogen was vented and the reaction mixture was concentrated in vacuo. 1H NMR of the crude product showed that full conversion was achieved. Purification of the residue by flash chromatography afforded pure anti-1,3-diol 4. The syn-1,3-diols were prepared using (S)-MeO-BIPHEP as a ligand.

(2R,4R)-Heptane-2,4-diol [(2R,4R)-4a]. Rf = 0.43 (cyclohexane/AcOEt 1/1, KMnO4); 1H NMR (CDCl3, 200 MHz): δ 0.90 (t, J = 6.8 Hz, 3H), 1.20 (d, J = 6.4 Hz, 3H), 1.40 (m, 4H), 1.56 (m, 2H), 3.92 (m, 1H), 4.13 (s sext, J = 6.0 Hz, 1H); 13C NMR (CDCl3, 50 MHz): δ 14.0, 18.9, 23.5, 39.5, 40.0, 65.4, 69.0; MS (DCI / NH4O+): m/z= 133 [M+H]^+, 150 [M+NH4]^+; IR (thin film): 3398, 2969, 2930, 2875 cm^-1; [α]D^25 --21.7 (c 1.15, CHCl3); GC analysis (diester with (S)-Mosher chloride): Column, J&W Scientific DB1701; gas, helium; flow: 1 mL/min; Tinjector: 250°C; Tdetector: 260°C; Toven: 210°C (1 min) then 10°C/min to 250°C; tR(2R,4R)= 9.94 min, tR(2S,4R)= 11.19 min; de = 98%.

Acknowledgements

We thank Dr. R. Schmid (Hoffmann La Roche) for generous gift of (R)- and (S)-MeO-BIPHEP: (R)-(+) and (S)-(−)-6,6'-dimethoxy-2,2''-bis(diphenyl-phosphinoyl)-1,1'-biphenyl. O.L. is grateful to the Ministère de l'Education Nationale et de la Recherche for a grant (2001-2004). This work was partially supported by a grant from the CPER (2000-2006 action 10040 ‘Pôle Chimie du Vivant’).
