Abstract
The synthesis of some new heterocyclic compounds containing spiro- benzopyrans, thiadiazoles, -selenadiazole and -thiadiazolines as sub-units in the molecule is achieved using a high- yielding synthetic protocol. The products were tested for antibacterial and antifungal activity.

Keywords: Antimicrobial activity, semicarbazones, spiro benzopyrans, 1,2,3-thiadiazoles, 1,2,3-selenadiazoles

Introduction
Resistance to antimicrobial agents is now recognized as a major global public health problem, so that the discovery of new antibacterial and antifungal compounds has become increasingly critical to fighting infectious disease.

Benzopyrans belong to an important structural class, which have valuable and diverse biological properties.1 Synthetic benzopyran derivatives including the K⁺ channel opener Cromakalim and the aldose reductase inhibitor Sorbinil exemplify the pharmacological importance of this heterocyclic sub-structure.2 Benzopyrans are found in many natural products, in particular the flavonoids and the cannabinoids.3 Chroman-4-ones are extensively used as synthetic intermediates. They have been used to synthesize various heterocyclic compounds which have wide ranges of pharmacological activities,4 for example Khellin is a coronary vasodilator.5,6 Chroman-4-one 2-carboxylic acids are spasmyloytic agents, and disodium chromoglycate acts an anti-allergenic drug.7 Therefore, benzopyrans were considered a good biological properties.1 Synthetic benzopyran derivatives including the K⁺ channel opener Cromakalim and the aldose reductase inhibitor Sorbinil exemplify the pharmacological importance of this heterocyclic sub-structure.2 Benzopyrans are found in many...
natural products, in particular the flavonoids and the cannabinoids.³ Chroman-4-ones are extensively used as synthetic intermediates. They have been used to synthesize various heterocyclic compounds which have wide ranges of pharmacological activities,⁴ for example Khellin is a coronary vasodilator.⁵,⁶ Chroman-4-one 2-carboxylic acids are spasmytic agents, and disodium chromoglycate acts an anti-allergenic drug.⁷ Therefore, benzopyrans were considered a good template to incorporate in novel 1,2,3-thiadiazole and 1,2,3-selenadiazole derivatives.

A simple 1,2,3-thiadiazole derivative is as potent as penicillin G in an in vitro inhibition zone assay.⁸ Several 1,2,3-thiadiazoles were synthesized by the method of Hurd and Mori ⁹ as collagen-induced inhibitors of platelet aggregation.¹⁰ 1,2,3-Selenadiazoles have generated wide interest owing to their ready conversion into selenium heterocycles¹¹ and reactive intermediates.¹² Selenium-containing heterocycles exhibit varied biological activities,¹³-¹⁶ which include anti-inflammatory agents, immuno-modifiers, cytokine inducers and enzyme inhibitors. Their chemotherapeutic activity has been reviewed.¹⁷

Oxidation of aldehyde thiosemicarbazones with NaOH/K₂[Fe(CN)₆] gives 1,3,4-thiadiazolines,¹⁸ and the synthesis of 5α-cholestan-3-spiro-(3,4-acetyl-2-acetylamino)-Δ²-1,3,4-thiadiazoline¹⁹ from 5α-cholestan-3-one thiosemicarbazone have been reported. A previously reported method of conversion of unsubstituted aldehyde thiosemicarbazones into 1,3,4-thiadiazolines involved the acetylation of thiosemicarbazones.²⁰-²² Spiro-1,3,4-thiadiazolines were shown to be potent medicinally active compounds.²³ Activities associated with chromone and the spiro thiadiazoline nucleus are a continuation of our work ²⁴-²⁸ and the molecules 2a–g, 3a–g, 4a–g, 5a–g and 6a–g could provide starting materials for the development of new classes of antimicrobial molecules.

**Results and Discussion**

**Chemistry**
The spiro[chroman-2,1’-cyclohexan]-4-ones 1a–g were converted into their semicarbazone derivatives 2a–g by reacting 1a–g with semicarbazide hydrochloride. Compounds 2a–g upon treatment with SeO₂ in glacial acetic acid gave the corresponding spiro(chromeno-[4,3-d][1,2,3]-selenadiazole-4,1’-cyclohexanes) 3a–g, whereas the same semicarbazones when treated with thionyl chloride gave the spiro(chromeno[4,3-d][1,2,3]thiadiazole-4,1’-cyclohexanes) 4a–g. The thiosemicarbazones 5a–g when heated with acetic anhydride gave (spiro-chroman-2,1’-cyclohexan-4-one)-5-spiro-4-acetyl-2-(acetylamino)-Δ²-1,3,4-thiadiazolines, 6a–g (see Scheme 1). The synthesized compounds were characterized by their analytical and spectroscopic data.

**Antimicrobial activity**
The antimicrobial activity of the synthesized compounds 2a–g, 3a–g, 4a–g, 5a–g and 6a–g was determined in vitro against a variety of bacteria and fungi. The tests were carried out using the agar spot method. For this study, test cultures of the bacterial strains *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Escherichia coli*, and *Enterococcus faecium* were each inoculated into
Tryptone Soya Broth. Similarly, test cultures of the fungal strains, *Candida krusei*, *Candida albicans*, and *Candida glabrata* were inoculated into Sabouraud Dextrose Broth.

The plates with test cultures were spotted serially with the extracts of the fermented cultures. Standard antibiotics for each culture were also spotted onto the respective plates as positive controls, and also for comparative study of the extract with an antibiotic. The compounds for antimicrobial studies were taken as extracts at 20µg/ml in DMSO, and each standard antibiotic at 20 µg/ml in DMSO. The plates were incubated in an incubator at 37°C overnight, and the zones of inhibition were measured in mm.

Scheme 1
All compounds were assayed for antimicrobial activity. From the data presented in Table 1, the preliminary screening results for the compounds 2a–g, 3a–g, 4a–g, 5a–g and 6a–g established that only compounds 2d, 2e, 6e, 3g, 4b, 4c and 4d showed some activity against one or two organisms, while the remaining derivatives were either inactive or weakly active against all the bacterial as well as fungal strains. In summary, their overall activity profiles were found to be moderate or poor.

Zone of inhibition (in mm): C = clear zone, H = hazy zone, VH = very hazy zone, - = no activity or less activity.
**Experimental Section**

**General.** Monitoring of the reactions and checking of purity of the products were done using precoated silica gel plates and visualization using an iodine / UV lamp. Melting points were taken in open capillaries and are uncorrected. IR spectra were recorded on Perkin-Elmer 1420 spectrophotometer. $^1\text{H}$ NMR spectra were recorded on a Varian 300 MHz spectrometer in CDCl$_3$ or DMSO as solvent with TMS as internal standard. Chemical shifts are in $\delta$ (ppm). Mass spectra were recorded on an HP 1100 LC/MSD instrument (positive and negative APCI ion source, 50-200 V, nitrogen). Elemental analysis was performed on a Perkin-Elmer analyzer. Compounds 1a–g were prepared by reported procedures.  

(Spiro[chroman-2,1’-cyclohexan]-4-one)semicarbazone 2a

Spiro[chroman-2,1’-cyclohexan]-4-one 1a (2.5g, 10 mmol) was reacted with semicarbazide hydrochloride (1.34g, 12 mmol) and sodium acetate (1.23g, 15 mmol) in absolute ethanol (25mL) under reflux for 1 h. The solid products given upon cooling were separated by filtration, dried, and crystallized from ethanol to give 1.78g of 2a. Compounds 2b–g were prepared similarly, with the physical and analytical data given below.

2a. ($R_1 = R_2 = H, R_3 = Cl$). Yield 58%, Yellow solid mp 195°C. IR (KBr): 3470, 2932, 2856, 1673, 1567, 1467, 1423, 1276 cm$^{-1}$; $^1\text{H}$ NMR (DMSO-d$_6$): $\delta$ 1.28-1.72 (m, 10H), 2.73 (s, 2H), 6.68 (brs, 2H, NH$_2$), 6.85 (d, 1H, $J = 8.7$ Hz), 7.20 (dd, 1H, $J = 8.4$, 2.4 Hz), 8.19 (d, 1H, $J = 2.4$ Hz), 9.50 (s, 1H, NH). Anal.: C, 58.38; H, 5.65; N, 13.25%. Calcd for C$_{15}$H$_{18}$ClN$_3$O$_2$: C, 58.54; H, 5.89; N, 13.65%.

2b. ($R_1 = R_2 = R_3 = H$). Yield 52%, Yellow solid mp 201°C. IR (KBr): 3471, 3264, 3210, 2931, 1716, 1682, 1584, 1457, 1229 cm$^{-1}$; $^1\text{H}$ NMR (DMSO-d$_6$): $\delta$ 1.28-1.90 (m, 10H), 2.73 (s, 2H), 6.54 (brs, 2H, NH$_2$), 6.81 (dd, 1H, $J = 8.1$, 1.2 Hz), 6.87 (t, 1H, $J = 7.8$ Hz), 7.20 (t, 1H, $J = 7.8$ Hz), 8.08 (dd, 1H, $J = 7.8$, 1.5 Hz), 9.44 (s, 1H, NH). **Spiro-(chromeno[4,3-d][1,2,3]thiadiazole-4,1'-cyclohexane) 3a**

The compound 2a (0.6g, 1.94 mmol) was added portionwise to an excess of freshly distilled thionyl chloride (6mL) at 0°C. The reaction mixture was then allowed to attain room temperature. After 1 h methylene chloride (15mL) was added and the resulting mixture was decomposed with saturated sodium carbonate. The methylene chloride layer was washed thoroughly with water and dried over anhydrous Na₂SO₄. Evaporation of solvent gave syrupy substance, which was purified by column chromatography to get pure 0.35g of 3a. Compounds 3b-g were prepared similarly. Physical and analytical data of 3a-g are given below.

3a. (R₁ = R₂ = H, R₃ = Cl). Yield 61%, Off-white solid mp 191°C. IR (KBr): 3479, 3132, 2932, 1673, 1472, 1420, 1279 cm⁻¹; ¹H NMR (DMSO-d₆): δ 1.38-1.96 (m, 3H), 1.60-1.96 (m, 5H), 2.08-2.18 (m, 2H), 7.20 (d, 1H, J = 9.0 Hz), 7.45 (d, 1H, J = 9.0 Hz), 8.03 (d, 1H, J = 2.4 Hz). Anal. Calcd for C₁₄H₁₃ClN₂O₂: C, 57.43; H, 4.48; N, 9.57. Found: C, 57.40; H, 4.30; N, 9.45%.

3b. (R₁ = R₂ = R₃ = H). Yield 56%, Brown solid mp 198°C. IR (KBr): 3429, 2928, 1611, 1480, 1226, 944, 766 cm⁻¹; ¹H NMR (DMSO-d₆): δ 1.38-1.96 (m, 8H), 2.20-2.28 (m, 2H), 7.05 (dd, 1H, J = 8.4, 0.9 Hz), 7.10 (t, 1H, J = 7.2 Hz), 7.31 (t, 1H, J = 8.1 Hz), 8.11 (dd, 1H, J = 7.2, 1.5 Hz). Anal. Calcd for C₁₄H₁₄N₂O₂: C, 65.09; H, 5.46; N, 10.84. Found: C, 64.90; H, 5.20; N, 10.48%.

3c. (R₁ = R₂ = H, R₃ = Br). Yield 59%, Off-white solid mp 260°C. IR (KBr): 3045, 1618, 1514, 1487, 1143, 682 cm⁻¹; ¹H NMR (DMSO-d₆): δ 1.32-1.58 (m, 3H), 1.62-1.92 (m, 5H), 2.12-2.22 (m, 2H), 7.15 (d, 1H, J = 8.4 Hz), 7.38 (dd, 1H, J = 8.7, 2.4 Hz), 8.00 (d, 1H, J = 2.4 Hz). **Spiro-(chromeno[4,3-d][1,2,3]selenadiazole-4,1'-cyclohexane) 4a**

Compound 2a (0.6g, 1.94 mmol) was dissolved in glacial acetic acid (10mL) and warmed to 60°C with stirring. To this selenium dioxide (0.215g, 1.94 mmol) was added portion wise during a period of 30 min and the stirring was continued at 60°C for 2-3 h till the evolution of gas ceased. After completion of the reaction, it was filtered to remove the deposited selenium. The filtrate was poured over crushed ice and the solid obtained was filtered, washed thoroughly with cold water and sodium carbonate and again with water. It was then purified by column chromatography to get pure 0.397g of 4a. Compounds 4b-f were prepared similarly. Physical and analytical data of 4a-g are given below.

4a. (R₁ = R₂ = R₃ = Cl). Yield 60%, Brown solid mp 83°C. IR (KBr): 2938, 1475, 1308, 1262, 1229, 948, 748 cm⁻¹; ¹H NMR (DMSO-d₆) : δ 1.36-1.58 (m, 3H), 1.62-1.92 (m, 5H), 2.12-2.22 (m, 2H), 7.09 (d, 1H, J = 8.7 Hz), 7.50 (dd, 1H, J = 8.4, 2.7 Hz), 8.12 (d, 1H, J = 2.1 Hz). **Spiro[chroman-2,1'-cyclohexan]-4-one thiosemicarbazone 5a**

To a solution of spiro [chroman-2, 1'-cyclohexan]-4-one 1a (1.5g, 6 mmol) in ethanol (25mL) a few drops of conc. HCl and the ethanolic solution of thiosemicarbazide (0.547g, 6 mmol) was added dropwise with constant stirring. The reaction mixture was refluxed for 3 h on a water-bath. After cooling, the solid product was filtered off and recrystallized from ethanol to get 1.16g of 5a. Compounds 5b-g were prepared similarly. Physical and analytical data of 5a-g are given below.

5a. ($R_1 = R_2 = H$, $R_3 = Cl$). Yield 60%, Yellow solid mp 230°. IR (KBr): 3431, 3285, 2929, 1613, 1582, 1506, 1441, 1226. cm$^{-1}$; $^1$H NMR (DMSO-$d_6$): $\delta$ 1.26-1.58 (m, 5H), 1.58-1.72 (m, 3H), 1.84-1.94 (m, 2H), 2.58 (s, 2H), 6.47 (brs, 1H, NH), 6.84 (d, 1H, J = 8.7 Hz), 7.21 (d, 1H, J = 8.7 Hz), 7.35 (brs, 1H, NH), 7.21 (d, 1H, J = 8.7 Hz), 7.90 (d, 1H, J = 3.0 Hz), 8.82 (brs, 1H, NH). Anal. Calcld for C$_{15}$H$_{18}$ClN$_2$: C, 55.63; H, 5.60; N, 12.98. Found: C, 55.50; H, 5.65; N, 13.12%.

5b. ($R_1 = R_2 = R_3 = H$). Yield 54%, Yellow solid mp 198°. IR (KBr): 3413, 3243, 3147, 2935, 1604, 1594, 1486, 1278. cm$^{-1}$; $^1$H NMR (DMSO-$d_6$): $\delta$ 1.24-1.56 (m, 5H), 1.61-1.76 (m, 3H), 1.86-1.96 (m, 2H), 2.60 (s, 2H), 6.43 (brs, 1H, NH), 6.87-6.95 (m, 2H), 7.28 (t, 1H, J = 6.9 Hz), 7.35 (brs, 1H, NH), 7.85 (d, 1H, J = 7.8 Hz), 8.78 (brs, 1H, NH). Anal. Calcld for C$_{15}$H$_{19}$N$_3$OS: C, 62.25; H, 6.62; N, 14.52. Found: C, 62.60; H, 6.30; N, 14.40.

5c. ($R_1 = R_2 = H$, $R_3 = Br$). Yield 55%, Yellow solid mp 185°. IR (KBr): 3375, 3233, 3154, 2929, 1594, 1502, 1462, 1279. cm$^{-1}$; $^1$H NMR (DMSO-$d_6$): $\delta$ 1.26-1.58 (m, 5H), 1.58-1.72 (m, 3H), 1.84-1.94 (m, 2H), 2.58 (s, 2H), 6.45 (brs, 1H, NH), 6.80 (d, 1H, J = 8.7 Hz), 7.34 (brs, 1H, NH), 7.35 (d, 1H, J = 8.7 Hz), 7.94 (d, 1H, J = 2.4 Hz), 8.78 (brs, 1H, NH). Spiro[chroman-2,1’-cyclohexan]-4-one-5-spiro-4-acetyl-2-(acetylamino)-∆^{2}-1,3,4-thiadiazolines 6a

Compound 5a (0.6g, 1.85 mmol) was treated with freshly distilled acetic anhydride (6mL) and the mixture was refluxed for 6-7 h on a water bath (90-100°C). The resulting contents were poured over crushed ice with vigorous stirring to give a pale yellow product, which was separated by filtration and purified by column chromatography to get pure 0.41g of 6a. Compounds 6b-g were prepared similarly. Physical and analytical data of 6a-g are given below.

6a. (R_{1} = R_{2} = H, R_{3} = Cl). Yield 54%, Off-white solid mp 143°C. IR (KBr): 2933, 1698, 1640, 1615, 1479, 1410, 1292, 1236, 755. cm\(^{-1}\); \(^{1}\)H NMR (DMSO-d_{6}) : δ 1.24-1.36 (m, 3H), 1.42-1.68 (m, 5H), 1.76-1.90 (m, 2H), 2.07 (s, 3H), 2.22 (s, 3H), 2.46 (d, 1H, J = 14.1 Hz), 3.30 (d, 1H, J = 14.1 Hz), 6.66 (d, 1H, J = 9.0 Hz), 7.19 (dd, 1H, J = 9.0, 2.4 Hz), 7.33 (dd, 1H, J = 2.4 Hz), 8.88 (s, 1H, due to NH).
