Abstract
4-Chloro-2-aryl-2H-3-chromenecarbaldehydes 3a-g on reaction with malononitrile in ethanol in the presence of piperidine gave 5-aryl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g in good yields.

Keywords: 4-Chloro-2-aryl-2H-3-chromenecarbaldehydes, malononitrile, piperidine

Introduction
Several chromanones, substituted chromenes and flavanones show a variety of biological activities, such as dopamine agonist1, antihypertensive2, ATP sensitive potassium channel opener3, antitumor4, gastroprotective5, coronary vasodilator6 and adrenergic receptor antagonist7. In the present study, new chromenopyridines 4a-g were synthesized starting from 4-chloro-2-aryl-2H-3-chromenecarbaldehydes 3a-g.

Several methods have been reported for the synthesis of substituted pyridones and piperidones.8-10 We developed a synthesis of ethyl 2-methyl-5-oxo-5H-[1]benzopyrano[3,4-c]-pyridine-1-carboxylates and ethyl 2-methyl-5H-chromeno[3,4-c]pyridine-1-carboxylates in a modified Hantzsch reaction by the reaction of 4-chloro-3-formylcoumarins and 4-chloro-2H-3-chromenecarbaldehydes with ethyl 3-aminocrotonate.11-13 We also reported the synthesis of 9-amino-6H-benzof[c]chromene-8,10-dicarbonitriles by the reaction of 2H-3-chromenecarbaldehydes with malononitrile and piperidine.14 In this present paper we report the results of the reaction of 4-chloro-2-aryl-2H-3-chromenecarbaldehydes 3a-g with malononitrile in ethanol-piperidine wherein there is formation of pyridine ring fused to chromene with the participation of piperidine as a nucleophile during the pyridine ring formation.
Results and Discussion

4-Chloro-2-aryl-2\(H\)-3-chromenecarbaldehydes 3a-g were prepared by the reaction of flavan-4-ones 2a-g with dry DMF/POCl\(_3\) by the Vilsmeier-Haack reaction.\(^{15}\) 4-Chloro-2-aryl-2\(H\)-3-chromenecarbaldehydes 3a-g, malononitrile and piperidine in dry ethanol were heated at 80 °C for 24 h. The crude product was purified using column chromatography to give 5-aryl-2-piperidino-5\(H\)-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g in good yields (Scheme 1).

![Scheme 1. Synthesis of 5-aryl-2-piperidino-5\(H\)-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g.](attachment:image.png)

Compound 4a is characterized as 9-chloro-5-phenyl-2-piperidino-5\(H\)-chromeno[3,4-c]-pyridine-1-carbonitrile. In the IR spectrum 4a showed a peak due to the nitrile group at 2205 cm\(^{-1}\). The UV spectrum of 4a showed bands at 218 nm (log \(\varepsilon\) 4.5), 280 nm (log \(\varepsilon\) 4.3) and 344 nm (log \(\varepsilon\) 3.7). \(^1\)H NMR of 4a showed that a piperidine moiety is incorporated in the newly formed pyridine ring. The piperidine 3\(^{\prime}\), 5\(^{\prime}\) and 4\(^{\prime}\) methylene protons appeared as a multiplet at \(\delta\) 1.75 and 2\(^{\prime}\),6\(^{\prime}\) methylene protons appeared as a multiplet at \(\delta\) 3.65. H-4 of the pyridine appeared as a singlet \(\delta\) 7.75, H-5 as a singlet at \(\delta\) 5.95 and H-10 as a doublet at \(\delta\) 8.40 (\(J = 2.0\) Hz). The other aromatic H-2,3,4,5,6,7,8 appeared as a multiplet at \(\delta\) 7.05-7.40. In the \(^{13}\)C NMR of 4a the piperidine ring carbons resonated at \(\delta\) 24.4 (C-4\(^{\prime}\)), 25.8 (C-3\(^{\prime}\),5\(^{\prime}\)) and 50.6 (C-
2″,6″), the pyridine ring carbons at δ 89.1 (C-1), 154.2 (C-2), 148.6 (C-4), 137.3 (C-4a), 142.0 (C-10b) and 120.8 (C≡N). The other carbons resonated at δ 77.4 (C-5), 118.1 (C-10a), 119.8 (C-7), 126.9 (C-10), 127.3 (C-1′), 127.3 (C-9), 127.6 (C-2′,6′), 128.7 (C-3′,5′), 128.9 (C-4′), 132.7 (C-8), 164.3 (C-6a). In the MS of 4a the molecular ion $M^+$ appeared at $m/z$ 401 (70). The base peak appeared at $m/z$ 400 (100) is due to loss of H radical from C-5 to give a resonance stabilized chromenyl cation.

The mechanism of the formation of 5-aryl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g is shown in Scheme 2. The first step is the nucleophilic substitution of the labile Cl by the malononitrile. A facile intramolecular nucleophilic attack by the nitrogen of CN on the CHO group leads to cyclic intermediate 6a-g. It is reaction with nucleophile piperidine, followed by loss of H$_2$O results in pyridine ring derivatives 6a-g. In several literature methods of pyridine synthesis, piperidine is used the solvent and acts as a base.$^{16,17}$ However, in the present reaction the piperidine is incorporated into the product structure. The structure of 4a is confirmed from single crystal X-ray analyses (Figure 1).

This work reports a new synthesis of pyridine fused to chromene, starting from the $\beta$-chloroacrolein moiety in the chromene and malononitrile in piperidine.

Scheme 2. Mechanism of the formation of 5-aryl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g.
General. All melting points were determined on a Polmon digital melting point apparatus (Model No. MP-96). IR spectra were recorded on a FT-IR Perkin-Elmer 1605 spectrophotometer using KBr discs and UV spectra were recorded on a Schimadzu UV-VIS 1601 spectrophotometer. The \(^1\)H NMR (200 MHz) and \(^{13}\)C NMR (50.3 MHz) spectra were recorded on a Varian Gemini Unity Spectrometer in CDCl\(_3\) using TMS as internal standard (chemical shifts in \(\delta\) ppm). Mass spectra were recorded on a VG micromass 7070H instrument. Elemental analyses were performed on an Elemental Vario El instrument. XRD were recorded on a Bruker Smart Apex CCD area detector on a D8 goniometer.

General procedure for the synthesis of 4-chloro-2-aryl-2\(H\)-3-chromenecarbaldehydes 3a-g

To a solution of flavan-4-ones 2a-g (10 mmoles) in dry dimethylformamide (50 mmoles) freshly distilled dry phosphorus oxychloride (10 mmoles) was added with constant stirring at 0 \(^\circ\)C. The reaction mixture was kept overnight and then poured onto crushed ice. The yellow compound which separated out was filtered and washed with water. The solid product which was purified by column chromatography over silica gel by eluting with petroleum ether gave 4-chloro-2-aryl-\(2H\)-3-chromenecarbaldehydes 3a-g in 70-85 % yields. Compounds 3a-g were recrystallised from methanol to give pale yellow needles.

General procedure for the synthesis of 5-aryl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g

4-Chloro-2-aryl-2H-3-chromenecarbaldehydes 3a-g (4 mmoles) and malononitrile (4 mmoles) were dissolved in ethanol (20 mL) and the piperidine (5 mL) was added and heated at 80 ºC for 24 h. The ethanol was distilled off and the reaction mixture was poured into crushed ice. The light yellow solid which separated out was filtered and washed with water. The crude product was chromatographed over silica gel by eluting with petroleum ether: ethyl acetate (8 : 2) to give 5-aryl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitriles 4a-g in 55-65 % yield, which were recrystallised from acetone as a yellowish needles.

9-Chloro-5-phenyl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitrile (4a). Calcd. for C$_23$H$_{23}$N$_3$O$_2$: C, 75.55, H, 5.83, N, 10.57. Found C, 75.38, H, 5.92, N, 10.64 %.

5-(4'-Methoxyphenyl)-9-methyl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitrile (4g). M.p. 158 ºC; IR (KBr): 2213 cm$^{-1}$ (CN); UV (MeOH): 223 nm (log ε 4.6), 276 nm (log ε 4.5), 346 nm (log ε 3.9); $^1$H NMR (200 MHz, CDCl$_3$): δ 1.70 (m, CH$_2$N-3",4",5"), 2.40 (s, 9-CH$_3$), 3.60 (m, CH$_2$N-2",6"), 3.80 (s, 4'-OCH$_3$), 5.95 (s, H-5), 6.90 (m, H-7,8), 7.25 (m, H-2',3',5',6'), 7.70 (s, H-4), 8.25 (d, J = 2.0 Hz, H-10); $^{13}$C NMR (50.3 MHz, CDCl$_3$): δ 20.8 (9-CH$_3$), 24.4 (C-4"), 25.8 (4-C-3",5"), 50.7 (C-2",6"), 55.2 (4'-OCH$_3$), 77.0 (C-5), 89.1 (C-1), 114.0 (C-3',5'), 118.7 (CN), 119.4 (C-7), 121.7 (C-10a), 127.0 (C-9), 127.0 (C-1'), 129.1 (C-2',6'), 129.8 (C-4a), 131.5 (C-8), 133.7 (C-10), 143.4 (C-10b), 148.3 (C-4), 153.5 (C-2), 159.8 (C-4'), 164.6 (C-6a); MS: m/z 411 M$^+$ (50), 410 (75), 396 (100), 382 (15), 328 (10), 304 (15), 285 (20), 271 (10) and 84 (20); Anal. Calcd. for C$_{26}$H$_{25}$N$_3$O$_2$: C, 75.89, H, 6.12, N, 10.21. Found C, 76.02, H, 6.25, N, 10.10 %.

X-ray crystallographic studies
A yellowish cube crystal of compound 4a was obtained from acetone/water (1:1) The crystal belongs to the monoclinic crystal system, space group Cc with a = 12.736 (12), b = 19.9162 (19), c = 8.4531 (8) Å, β = 108.95 (0)°, V = 2027.94 (33) Å$^3$, Z = 4, λ = 0.71073 Å, μ (MoKα) = 2.086 mm$^{-1}$, F(000) = 840.0, T = 273 (2) K. Data collection yielded 6126 reflections resulting in 3512 unique (I>2σ(I)), θ range: 1.98 – 28.02°. Full matrix least-squares refinement led to a final R = 0.0464, wR = 0.1196 and GOF = 1.029. Diffraction data were measured at room temperature with a Bruker SMART Apex CCD area detector on a D8 goniometer. Preliminary lattice parameters and orientation matrices were obtained from three sets of frames. Intensity data were collected using graphite-monochromated MoKα radiation (λ = 0.71073 Å) with the ω-scan method. Integration and scaling of intensity data was accomplished using SAINT$^{17}$ and absorption corrections were performed using SADABS.$^{18}$ The structures were solved by direct methods and refined by a full matrix least-squares procedure based on F.$^{19,20}$ Crystallographic data for the structure of 9-chloro-5-phenyl-2-piperidino-5H-chromeno[3,4-c]pyridine-1-carbonitrile 4a have been deposited with the Cambridge Crystallographic Data Center as supplementary publication number CCDC 270792.

Acknowledgements
One of the authors (M. Venkati) thanks the CSIR, New Delhi for financial support and grant of SRF. Our sincere thanks to the Director, IICT, Dr. J.S. Yadav, Hyderabad, India for providing spectral data and library facilities.
